Chapter 1

Overview

The libspe2 functionality is split into 4 libraries:

- **libspe-base** This library provides the basic infrastructure to manage and use SPEs. The central data structure is a SPE context [spe_context](#). It contains all information necessary to manage an SPE, run code on it, communicate with it, and so on. To use the libspe-base library, the header file **spebase.h** has to be included and an application needs to link against **libspebase.a** or **libspebase.so**.
- **libspe-event** This is a convenience library for the handling of events generated by an SPE. It is based on libspe-base and epoll. Since the [spe_context](#) introduced by libspe-base contains the file descriptors to mailboxes etc, any other event handling mechanism could also be implemented based on libspe-base.

1.1 Terminology

- **main thread** usually the application main thread running on a PPE
- **SPE thread** a thread that uses SPEs. Execution starts on the PPE. Execution shifts between PPE and an SPE back and fro, e.g., PPE services system calls for SPE transparently

1.2 Usage Scenarios

1.2.1 Single-threaded sample

Note: In the new model, it is not necessary to have a main thread - the SPE thread can be the only application thread. It may run parts of its code on PPE and then start an SPE, e.g., for an accelerated function. The main thread is needed only if you want to use multiple SPEs concurrently. The following minimalistic sample illustrates the basic steps:

Figure 1.1: Simple program

```

#include <stdlib.h>
#include "libspe2.h"

int main()
{
    spe_context_ptr_t ctx;
    unsigned int flags = 0;
    unsigned int entry = SPE_DEFAULT_ENTRY;
    void * argp = NULL;
    void * envp = NULL;
    spe_program_handle_t * program;

    program = spe_image_open("hello");

    ctx = spe_context_create(flags, 0);
    spe_program_load(ctx, program);
    spe_context_run(ctx, &entry, flags, argp, envp, NULL);
    spe_context_destroy(ctx);
}

```

Here is the same sample with some error checking:

```

#include <errno.h>
#include <stdio.h>
#include <stdlib.h>
#include "libspe2.h"

int main(void)
{
    spe_context_ptr_t ctx;
    int flags = 0;
    unsigned int entry = SPE_DEFAULT_ENTRY;
    void * argp = NULL;
    void * envp = NULL;
    spe_program_handle_t * program;

```

```

spe_stop_info_t stop_info;
int rc;

program = spe_image_open("hello");
if (!program) {
    perror("spe_open_image");
    return -1;
}

ctx = spe_context_create(flags, NULL);
if (ctx == NULL) {
    perror("spe_context_create");
    return -2;
}
if (spe_program_load(ctx, program)) {
    perror("spe_program_load");
    return -3;
}
rc = spe_context_run(ctx, &entry, 0, argp, envp, &stop_info);
if (rc < 0)
    perror("spe_context_run");

spe_context_destroy(ctx);

return 0;
}

```

1.2.2 Multi-threaded sample

This illustrates a threaded sample using the pthread library:

Figure 1.2: Simple pthread program

```

#include <stdlib.h>
#include <pthread.h>

```

```

#include "libspe2.h"

struct thread_args {
    struct spe_context * ctx;
    void * argp;
    void * envp;
};

void * spe_thread(void * arg)
{
    int flags = 0;
    unsigned int entry = SPE_DEFAULT_ENTRY;
    spe_program_handle_t * program;
    struct thread_args * arg_ptr;

    arg_ptr = (struct thread_args *) arg;

    program = spe_image_open("hello");
    spe_program_load(arg_ptr->ctx, program);
    spe_context_run(arg_ptr->ctx, &entry, flags, arg_ptr->argp, arg_ptr->envp, NULL);
    pthread_exit(NULL);
}

int main() {
    int thread_id;
    pthread_t pts;
    spe_context_ptr_t ctx;
    struct thread_args t_args;
    int value = 1;

    ctx = spe_context_create(0, NULL);

    t_args.ctx = ctx;
    t_args.argp = &value;

    thread_id = pthread_create(&pts, NULL, &spe_thread, &t_args);

    pthread_join(pts, NULL);
    spe_context_destroy(ctx);

    return 0;
}

```

Here is the same sample with some error checking:

```

#include <errno.h>
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include "libspe2.h"

struct thread_args {
    struct spe_context * ctx;
    void * argp;
    void * envp;
};

void * spe_thread(void * arg);

__attribute__((noreturn)) void * spe_thread(void * arg)
{
    int flags = 0;
    unsigned int entry = SPE_DEFAULT_ENTRY;
    int rc;
    spe_program_handle_t * program;
    struct thread_args * arg_ptr;

```

```

    arg_ptr = (struct thread_args *) arg;

    program = spe_image_open("hello");
    if (!program) {
        perror("spe_image_open");
        pthread_exit(NULL);
    }

    if (spe_program_load(arg_ptr->ctx, program)) {
        perror("spe_program_load");
        pthread_exit(NULL);
    }

    rc = spe_context_run(arg_ptr->ctx, &entry, flags, arg_ptr->argp, arg_ptr->envp, NULL);
    if (rc < 0)
        perror("spe_context_run");

    pthread_exit(NULL);
}

int main() {
    int thread_id;
    pthread_t pts;
    spe_context_ptr_t ctx;
    struct thread_args t_args;
    int value = 1;
    int flags = 0;

    if (!(ctx = spe_context_create(flags, NULL))) {
        perror("spe_create_context");
        return -2;
    }

    t_args.ctx = ctx;
    t_args.argp = &value;

    thread_id = pthread_create(&pts, NULL, &spe_thread, &t_args);

    pthread_join(pts, NULL);
    spe_context_destroy(ctx);

    return 0;
}

```

1.2.3 Problem state mapping samples

This illustrates accessing the MFC Local Store Address Register.

```

#include <stdio.h>
#include <stdlib.h>
#include "libspe2.h"

int main(void)
{
    spe_context_ptr_t ctx;
    int flags = SPE_MAP_PS;
    struct spe_mfc_command_area * mfc_cmd_area;
    struct spe_spu_control_area * spu_control_area;
    unsigned int MFC_LSA;
    unsigned int status;

    printf("starting ..\n");
    ctx = spe_context_create(flags, NULL);

```

```

mfc_cmd_area = spe_ps_area_get(ctx, SPE_MFC_COMMAND_AREA);
printf("mfc_cmd_area is: %p\n", mfc_cmd_area);
MFC_LSA = mfc_cmd_area->MFC_LSA;
spu_control_area = spe_ps_area_get(ctx, SPE_CONTROL_AREA);
status = spu_control_area->SPU_Status;
spe_context_destroy(ctx);
printf("%d done\n", status);
printf("%d done\n", MFC_LSA);
}

```

1.2.4 Event samples

This illustrates a sample using the event library. The event, which we receive is of course that the spu program has stopped, because otherwise we would not get there.

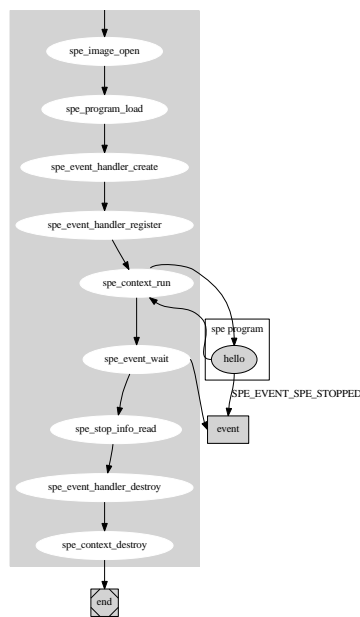

Figure 1.3: Simple event program

```

#include <libspe2.h>

#define MAX_EVENTS 8
#define SIZE 8
#define COUNT 1

int main()
{
    int i, rc, event_count;
    spe_event_handler_ptr_t evhandler;
    spe_event_unit_t event;
    spe_context_ptr_t ctx;
    spe_event_unit_t events[MAX_EVENTS];
    spe_stop_info_t stop_info;
    spe_program_handle_t * program;
    unsigned int entry = SPE_DEFAULT_ENTRY;
    void * argp = NULL;
    void * envp = NULL;

```

```

/* Create a context. */
ctx = spe_context_create(SPE_EVENTS_ENABLE, NULL);
if (ctx == NULL) {
    perror("spe_context_create");
    return -2;
}

/* load the program. */
program = spe_image_open("hello");
if (!program) {
    perror("spe_open_image");
    return -1;
}

if (spe_program_load(ctx, program)) {
    perror("spe_program_load");
    return -3;
}

/* Create a handle. */
evhandler = spe_event_handler_create();

/* Register events. */
event.events = SPE_EVENT_SPE_STOPPED;
event.spe = ctx;
rc = spe_event_handler_register(evhandler, &event);

/* run the context */
rc = spe_context_run(ctx, &entry, 0, argp, envp, &stop_info);
if (rc < 0)
    perror("spe_context_run");

/* Get events. */
event_count = spe_event_wait(evhandler, events, MAX_EVENTS, 0);
printf("event_count: %d\n", event_count);

/* Handle events. */
for (i = 0; i < event_count; i++) {
    printf("event %d: %d\n", i, events[i].events);
    if (events[i].events & SPE_EVENT_SPE_STOPPED) {
        printf("received SPE_EVENT_SPE_STOPPED\n");
        rc = spe_stop_info_read(events[i].spe, &stop_info);
        printf("exit_code: %d\n", stop_info.result.spe_exit_code);
    }
}

/* Destroy the handle. */
spe_event_handler_destroy(evhandler);

/* Destroy the context. */
spe_context_destroy(ctx);

return 0;
}

```

Events are more useful in multithreaded environments:

```

#include <errno.h>
#include <stdio.h>
#include <stdlib.h>
#include <pthread.h>
#include "libspe2.h"

#define MAX_EVENTS 8
#define SIZE 8

```

```

#define COUNT 1

struct thread_args {
    struct spe_context * ctx;
    void * argp;
    void * envp;
};

void * spe_thread(void * arg);

__attribute__((noreturn)) void * spe_thread(void * arg)
{
    int flags = 0;
    unsigned int entry = SPE_DEFAULT_ENTRY;
    int rc;
    spe_program_handle_t * program;
    struct thread_args * arg_ptr;

    arg_ptr = (struct thread_args *) arg;

    program = spe_image_open("hellointr");
    if (!program) {
        perror("spe_image_open");
        pthread_exit(NULL);
    }

    if (spe_program_load(arg_ptr->ctx, program)) {
        perror("spe_program_load");
        pthread_exit(NULL);
    }

    rc = spe_context_run(arg_ptr->ctx, &entry, flags, arg_ptr->argp, arg_ptr->envp, NULL);
    if (rc < 0)
        perror("spe_context_run");

    pthread_exit(NULL);
}

int main() {
    int thread_id;
    int i, rc, event_count;
    pthread_t pts;
    spe_context_ptr_t ctx;
    struct thread_args t_args;
    int value = 1;
    int flags = SPE_EVENTS_ENABLE;
    spe_event_handler_ptr_t evhandler;
    spe_event_unit_t event;
    spe_event_unit_t events[MAX_EVENTS];
    unsigned int mbox_data[COUNT];
    spe_stop_info_t stop_info;
    int cont;

    if (!(ctx = spe_context_create(flags, NULL))) {
        perror("spe_create_context");
        return -2;
    }

    /* Create a handle. */
    evhandler = spe_event_handler_create();

    /* Register events. */
    event.events = SPE_EVENT_OUT_INTR_MBOX | SPE_EVENT_SPE_STOPPED;
    event.spe = ctx;
    rc = spe_event_handler_register(evhandler, &event);

    /* start pthread */

```

```
t_args.ctx = ctx;
t_args.argp = &value;

thread_id = pthread_create( &pts, NULL, &spe_thread, &t_args);

/* Get events. */
cont = 1;
while (cont) {
    event_count = spe_event_wait(evhandler, events, MAX_EVENTS, -1);
    printf("event_count %d\n", event_count);

    /* Handle events. */
    for (i = 0; i < event_count; i++) {
        printf("event %d: %d\n", i, events[i].events);
        if (events[i].events & SPE_EVENT_OUT_INTR_MBOX) {
            printf("SPE_EVENT_OUT_INTR_MBOX\n");
            rc = spe_out_intr_mbox_read(events[i].spe,
                                         mbox_data,
                                         COUNT,
                                         SPE_MBOX_ANY_BLOCKING);
        }
        if (events[i].events & SPE_EVENT_SPE_STOPPED) {
            printf("SPE_EVENT_SPE_STOPPED\n");
            rc = spe_stop_info_read(events[i].spe, &stop_info);
            printf("stop_reason: %d\n", stop_info.stop_reason);
            cont = 0;
        }
    }
}

pthread_join (pts, NULL);

/* Destroy the handle. */
spe_event_handler_destroy(evhandler);

/* Destroy the context. */
spe_context_destroy (ctx);

return 0;
}
```

Chapter 2

Data Structure Documentation

2.1 spe_context Struct Reference

Data Fields

- [spe_program_handle_t](#) handle
- struct spe_context_base_priv * [base_private](#)
- struct spe_context_event_priv * [event_private](#)

2.1.1 Detailed Description

SPE context The SPE context is one of the base data structures for the libspe2 implementation. It holds all persistent information about a "logical SPE" used by the application. This data structure should not be accessed directly, but the application uses a pointer to an SPE context as an identifier for the "logical SPE" it is dealing with through libspe2 API calls.

2.1.2 Field Documentation

2.1.2.1 struct spe_context_base_priv* [base_private](#) [read]

2.1.2.2 struct spe_context_event_priv* [event_private](#) [read]

2.1.2.3 [spe_program_handle_t](#) handle

2.2 spe_event_data Union Reference

Data Fields

- void * [ptr](#)
- unsigned int [u32](#)
- unsigned long long [u64](#)

2.2.1 Detailed Description

spe_event_data_t User data to be associated with an event

2.2.2 Field Documentation

2.2.2.1 void* ptr

2.2.2.2 unsigned int u32

2.2.2.3 unsigned long long u64

2.3 spe_event_unit Struct Reference

Data Fields

- unsigned int [events](#)
- [spe_context_ptr_t](#) spe
- [spe_event_data_t](#) data

2.3.1 Detailed Description

spe_event_t

2.3.2 Field Documentation

2.3.2.1 spe_event_data_t data

2.3.2.2 unsigned int events

2.3.2.3 spe_context_ptr_t spe

2.4 spe_gang_context Struct Reference

Data Fields

- struct spe_gang_context_base_priv * [base_private](#)
- struct spe_gang_context_event_priv * [event_private](#)

2.4.1 Detailed Description

SPE gang context The SPE gang context is one of the base data structures for the libspe2 implementation. It holds all persistent information about a group of SPE contexts that should be treated as a gang, i.e., be execute together with certain properties. This data structure should not be accessed directly, but the application uses a pointer to an SPE gang context as an identifier for the SPE gang it is dealing with through libspe2 API calls.

2.4.2 Field Documentation

2.4.2.1 struct spe_gang_context_base_priv* [base_private](#) [read]

2.4.2.2 struct spe_gang_context_event_priv* [event_private](#) [read]

2.5 spe_program_handle Struct Reference

Data Fields

- unsigned int [handle_size](#)
- void * [elf_image](#)
- void * [toe_shadow](#)

2.5.1 Detailed Description

SPE program handle Structure [spe_program_handle](#) per CESOF specification libspe2 applications usually only keep a pointer to the program handle and do not use the structure directly.

2.5.2 Field Documentation

2.5.2.1 void* elf_image

2.5.2.2 unsigned int handle_size

2.5.2.3 void* toe_shadow

2.6 spe_stop_info Struct Reference

Data Fields

- unsigned int [stop_reason](#)
- union {
 - int [spe_exit_code](#)
 - int [spe_signal_code](#)
 - int [spe_runtime_error](#)
 - int [spe_runtime_exception](#)
 - int [spe_runtime_fatal](#)
 - int [spe_callback_error](#)
 - int [spe_isolation_error](#)
 - void * [__reserved_ptr](#)
 - unsigned long long [__reserved_u64](#)
- } [result](#)
- int [spu_status](#)

2.6.1 Detailed Description

`spe_stop_info_t`

2.6.2 Field Documentation

2.6.2.1 void* [__reserved_ptr](#)

2.6.2.2 unsigned long long [__reserved_u64](#)

2.6.2.3 union { ... } [result](#)

2.6.2.4 int [spe_callback_error](#)

2.6.2.5 int [spe_exit_code](#)

2.6.2.6 int [spe_isolation_error](#)

2.6.2.7 int [spe_runtime_error](#)

2.6.2.8 int [spe_runtime_exception](#)

2.6.2.9 int [spe_runtime_fatal](#)

2.6.2.10 int [spe_signal_code](#)

2.6.2.11 int [spu_status](#)

2.6.2.12 unsigned int [stop_reason](#)

3.2.1.40 #define SPE_SPU_SINGLE_STEP 0x10

3.2.1.41 #define SPE_SPU_STOPPED_BY_STOP 0x02

Runtime errors

3.2.1.42 `#define SPE_SPU_WAITING_ON_CHANNEL 0x08`

3.2.1.43 `#define SPE_STOP_AND_SIGNAL 2`

3.2.1.44 `#define SPE_TAG_ALL 1`

Behavior flags tag status functions

3.2.1.45 `#define SPE_TAG_ANY 2`

3.2.1.46 `#define SPE_TAG_IMMEDIATE 3`

3.2.2 Typedef Documentation

3.2.2.1 `typedef struct spe_context* spe_context_ptr_t`

`spe_context_ptr_t` This pointer serves as the identifier for a specific SPE context throughout the API (where needed)

3.2.2.2 `typedef union spe_event_data spe_event_data_t`

`spe_event_data_t` User data to be associated with an event

3.2.2.3 `typedef void* spe_event_handler_ptr_t`

3.2.2.4 `typedef int spe_event_handler_t`

3.2.2.5 `typedef struct spe_event_unit spe_event_unit_t`

`spe_event_t`

3.2.2.6 `typedef struct spe_gang_context* spe_gang_context_ptr_t`

`spe_gang_context_ptr_t` This pointer serves as the identifier for a specific SPE gang context throughout the API (where needed)

3.2.2.7 `typedef struct spe_program_handle spe_program_handle_t`

SPE program handle Structure [spe_program_handle](#) per CESOF specification libspe2 applications usually only keep a pointer to the program handle and do not use the structure directly.

3.2.2.8 `typedef struct spe_stop_info spe_stop_info_t`

`spe_stop_info_t`

3.2.3 Enumeration Type Documentation

3.2.3.1 enum ps_area

Enumerator:

SPE_MSSYNC_AREA

SPE_MFC_COMMAND_AREA

SPE_CONTROL_AREA

SPE_SIG_NOTIFY_1_AREA

SPE_SIG_NOTIFY_2_AREA

3.3 libspe2.h File Reference
