ltdirchk.dtx

1 L^AT_EX System Dependent Initialisations

This file implements the semi-automatic determination of various system dependent parts of the initialisation. The actual definitions may be placed in a file `texsys.cfg`. Thus for operating systems for which the tests here do not result in acceptable settings, a ‘hand written’ `texsys.cfg` may be produced.

The macros that must be defined are:

`\@currdir`

`\@currdir<filename><space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or `<space>`. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path`

If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if `<dir>` is an entry in the input path, T_EX will try to load the expansion of `<dir><filename><space>`

So either `<dir>` should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the `<filename>`. This means that for UNIX-like syntax, each `<dir>` should end with a slash, /.

`\input@path` should expand to a list of such directories, each in a {} group.

`\filename@parse`

After a call of the form: `\filename@parse{<filename>}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in `<filename>`, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS and Macintosh syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS T_EX versions. Currently if the UNIX, VMS or Macintosh parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion`

`\@TeXversion` is now set automatically by the initialisation tests in this file. You should not need to set it in `texsys.cfg`, however the following documentation

is left for information. L^AT_EX does not set this variable exactly, the automatic tests set it to:

- 2 for any version, v , $v < 3.0$
- 3 for any version, v , $3.0 \leq v \leq 3.14$
- (*undefined*) otherwise.

However these values are accurate enough for L^AT_EX to take appropriate action for these old T_EXs.

If your T_EX is older than version 3.141, then you should define `\@TeXversion` (using `\def`) to be the version number. If you do not do this¹, L^AT_EX will not work around a bug in old T_EX versions, and so error messages will appear in a very strange format, with `^J` appearing instead of line breaks:

```
! LaTeX Error: \rubbish undefined.^J^JSee the LaTeX manual or LaTeX Companion  
for explanation.^JType H <return> for immediate help.  
...
```

```
1.3 \renewcommand{\rubbish}  
    {}  
?
```

However if you put `\def\@TeXversion{3.14}` in `texsys.cfg` the following format will be used:

```
! LaTeX Error: \rubbish undefined.  
  
See the LaTeX manual or LaTeX Companion for explanation.  
Type H <return> for immediate help.  
!  
...  
  
1.3 \renewcommand{\rubbish}  
    {}  
?
```

Note that this has an extra line `! .` which does not appear in error messages that use the default settings with a current version of T_EX, but this should not cause any confusion we hope.

2 Initialisation

As this file is read at a very early stage, some definitions that are normally considered to be part of the format must be made here.

2.1 INITEX

```
1 (*dircheck)  
2 (*initex)  
3 (initex)\ifnum\catcode`\'f=1  
4 (initex)  \errmessage  
5 (initex)  {LaTeX must be made using an initex with no format preloaded}
```

¹Actually if your T_EX is really old, version 2, L^AT_EX can detect this, and sets `\@TeXversion` to 2 if it is not set in the `cfg` file.

```

```

3 texsys.cfg

As mentioned above, any site specific definitions required to describe the filename handling must be entered into a file `texsys.cfg`. If `texsys.cfg` can not be located by `\openin`, we write a default version out. The default version only contains comments, so we do not actually input the file in that case. The automatic tests later will, hopefully, correctly define the required macros.

The tricky code below checks to see if `texsys.cfg` exists. If it does not, all the text in this file between START and END is copied verbatim to a new file `texsys.cfg`. If `texsys.cfg` is found, then it is simply input. This is only done when this file is being used unstripped.

```

60 (*docstrip)
61 \openin15=texsys.cfg

75 \def\reserved@c{\%END}
76 \reserved@d

START

```

3.1 texsys.cfg

This file contains the site specific definitions of the four macros
`\@currdir`, `\input@path`, `\filename@parse` and `\CTeXversion`.

As distributed it only contains comments, however this ‘empty’ file will work on many systems because of the automatic tests built into `ltdirchk.dtx`. You are allowed to edit this file to add definitions of these macros appropriate to your system.

The macros that must be defined are:

`\@currdir<filename><space>` should expand to a form of the filename that uniquely refers to the ‘current directory’ if this is possible. (The expansion should also end with a space.) on UNIX, this is `\def\@currdir{./}`. For more exotic

operating systems you may want to make `\@currdir` a macro with arguments delimited by . and/or $\langle space \rangle$. If the operating system has no concept of directory structure, this macro should be defined to be empty.

`\input@path`

If the primitive `\openin` searches the same directories as the primitive `\input`, then it is possible to tell (using `\ifeof`) whether a file exists before trying to input it. For systems like this, `\input@path` should be left undefined.

If `\openin` does not ‘follow’ `\input` then `\input@path` must be defined to be a list of directories to search for input files. The format for each directory is as for `\@currdir`, normally just a prefix is required, but it may be a macro with space-delimited argument. That is, if $\langle dir \rangle$ is an entry in the input path, TeX will try to load the expansion of

$\langle dir \rangle \langle filename \rangle \langle space \rangle$

So either $\langle dir \rangle$ should be defined as a macro with argument delimited by space, or it should just expand to a directory name, including the final directory separator, so that it may be concatenated with the $\langle filename \rangle$. This means that for UNIX-like syntax, each $\langle dir \rangle$ should end with a slash, /. One exception to this rule is that the input path should *always* contain the empty directory {} as this will allow ‘full pathnames’ to be used, and the ‘current directory’ to be searched.

`\input@path` should expand to a list of such directories, each in a {} group.

`\filename@parse`

After a call of the form: `\filename@parse{\filename}`, the three macros `\filename@area`, `\filename@base`, `\filename@ext` should be defined to be the ‘area’ (or directory), basename and extension respectively. If there was no extension specified in $\langle filename \rangle$, `\filename@ext` should be `\let` to `\relax` (so this case may be tested with `\@ifundefined{\filename@ext}` and, perhaps a default extension substituted).

Normally one would not need to define this macro in `texsys.cfg` as the automatic tests can supply parsers that work with UNIX and VMS syntax, as well as a basic parser that will cover many other cases. However some operating systems may need a ‘hand produced’ parser in which case it should be defined in this file.

The UNIX parser also works for most MSDOS TeX versions. Currently if the UNIX or VMS parser is not used, `\filename@parse` is defined to always return an empty area, and to split the argument into basename and extension at the first ‘.’ that occurs in the name. Parsers for other formats may be defined in `texsys.cfg`, in which case they will be used in preference to the default definitions.

`\@TeXversion`

You should not need to set this macro in `texsys.cfg`. L^AT_EX tests to set this automatically. See the comments in the opening section of `ltdirchk.dtx`.

The following sections give examples of definitions which might work on various systems. These are currently mainly untested as I only have access to a few systems, all of which do not need this file as the automatic tests work. All the code is commented out.

3.2 UNIX (web2c)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
77 %\def\@currdir{./}
78 %\let\input@path\@undefined
```

3.3 UNIX (other)

Apparently some commercial UNIX implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`.

```
79 % \def\@currdir{./}
80 % \def\input@path{%
81 %   {/usr/local/lib/tex(inputs/distrib/}%
82 %   {/usr/local/lib/tex(inputs/contrib/}%
83 %   {/usr/local/lib/tex(inputs/local/}%
84 % }
```

3.4 MSDOS (emtex)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
85 % \def\@currdir{./}
86 % \let\input@path\undefined
```

3.5 MSDOS (other)

Some PC implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever directories are used at your site): note that the directory names should end with `/`. This assumes the implementation uses UNIX style `/` as the directory separator.

```
87 % \def\@currdir{./}
88 % \def\input@path{%
89 %   {c:/tex(inputs/distrib/}%
90 %   {c:/tex(inputs/contrib/}%
91 %   {c:/tex(inputs/local/}%
92 % }
```

3.6 VMS (DECUS TEX, PD VMS 3.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
93 % \def\@currdir{[]}
94 % \let\input@path\undefined
```

3.7 VMS (???)

Some VMS implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following:

```
95 % \def\@currdir{[]}
96 % \def\input@path{%
97 %   {tex_inputs:}%
98 %   {SOMEDISK:[SOME.TEX DIRECTORY]}%
99 % }
```

3.8 MACINTOSH (OzTeX 1.6)

This implementation does make `\openin` and `\input` look in the same places. Acceptable settings are made by `ltdirchk.dtx`, and so this file may be empty. The definitions below are therefore just for information.

```
100 % \def\@currdir{:  
101 % \let\input@path\undefined
```

3.9 MACINTOSH (other)

Some Macintosh implementations have different paths for `\openin` and `\input`. For these one could use definitions like the following (with whatever folders are used on your machine): note that the directory names should end with `:`, and they should contain *no* spaces.

```
102 % \def\@currdir{:  
103 % \def\input@path{  
104 %   {Hard-Disk:Applications:TeX:TeX-inputs:  
105 %   {Hard-Disk:Applications:TeX:My-inputs:  
106 % }
```

3.10 FAKE EXAMPLE

This example is for an operating system that has filenames of the form `<area>name`. For maximum compatibility with macro sets, you want `name.ext` to be mapped to `<ext>name`. and `<area>name.ext` to be mapped to `<area.ext>name`. `\input` does this mapping automatically, but `\openin` does not, and does not look in the same places as `\input`. `<>name` is the desired ‘current directory’ syntax.

the following code would possibly work:

```
107 % \def\@dir#1#2 {  
108 %   \@d@r{#1}#2..\@nil  
109 % \def\@d@r#1#2.#3.#4\@nil{  
110 %   <\ifx\@dir#1\@dir\else#1\ifx\@dir#3\@dir\else.\fi\fi#3>#2 }  
111 %  
112 % \def\@currdir{\@dir{}}  
113 % \def\input@path{  
114 %   {\@dir{area.one}}%  
115 %   {\@dir{area.two}}%  
116 % }  
END  
117 \immediate\closeout15  
If texsys.cfg did exist, then input it.  
118 \else  
119 \typeout{** Using the existing texsys.cfg}  
120 \closein15  
121 \input texsys.cfg  
122 \fi  
123 </docstrip>
```

If the stripped version of this file is being used (in `latex2e.ltx`) then `texsys.cfg` should be there, so just input it.

```
124 <dircheck>\input texsys.cfg
```

4 Setting \@currdir

\@currdir This is a local definition of \IfFileExists. It tries to relocate `texsys.aux`. If it succeeds, then the \@currdir syntax has been determined. If all the tests fail then \@currdir will be set to \empty, and `ltxcheck` will warn of this when it checks the format.

```
125 \begingroup
126 \count@\time
127 \divide\count@ 60
128 \count2=-\count@
129 \multiply\count2 60
130 \advance\count2 \time
```

\today The current date and time stamp.

```
131 \edef\today{%
132   \the\year/\two@digits{\the\month}/\two@digits{\the\day}:
133   \two@digits{\the\count@}:\two@digits{\the\count2}}
```

Create a file `texsys.aux` (hopefully in the current directory), then try to locate it again.

```
134 \immediate\openout15=texsys.aux
135 \immediate\write15{\today^J}
136 \immediate\closeout15 %

#1 is the file to try, #2 is what to do on success, #3 on failure.

137 \def\IfFileExists#1#2#3{%
138   \openin\@inputcheck#1 %
139   \ifeof\@inputcheck
140     #3\relax
141   \else
142     \read\@inputcheck to \reserved@a
143     \ifx\reserved@a\today
144       \typeout{#1 found}#2\relax
145     \else
146       \typeout{BAD: old file \reserved@a (should be \today)}%
147       #3\relax
148     \fi
149   \fi
150   \closein\@inputcheck}

151 \endlinechar=-1
```

If \@currdir has not been pre-defined in `texsys.cfg` then test for UNIX, VMS and Oz-TEX-Mac. syntax.

```
152 \ifx\@currdir\@undefined
153   \IfFileExists{./texsys.aux}{\gdef\@currdir{./}}%
154   {\IfFileExists{[]texsys.aux}{\gdef\@currdir{[]}}%
155   {\IfFileExists{:texsys.aux}{\gdef\@currdir{:}}{}}}
```

If it is still undefined at this point, all the above tests failed. Earlier versions interactively prompted for a definition at this point, but it seems impossible to reliably obtain information from users at this point in the installation. This version of the file produces a format with no user-interaction. Later if the format is not suitable for the system, `texsys.cfg` may be edited and the format re-made.

```

156 \ifx\@currdir\@undefined
157   \global\let\@currdir\@empty
158   \typeout{^^J^^J%
159     !! No syntax for the current directory could be found^^J%
160   }%
161 \fi

```

Otherwise `\@currdir` was defined in `texsys.cfg`. In this case check that the syntax specified works on this system. (In case a complete L^AT_EX system has been copied from one system to another.) If the test fails, give up. The installer should remove or correct the offending `texsys.cfg` and try again.

```

162 \else
163   \IfFileExists{\@currdir texsys.aux}{}{%
164     \edef\reserved@a{\errhelp{%
165       texsys.cfg specifies the current directory syntax to be^^J%
166       \meaning\@currdir^^J%
167       but this does not work on this system.^^J%
168       Remove texsys.cfg and restart.}}\reserved@a
169   \errmessage{Bad texsys.cfg file: \noexpand\@currdir}\@end}

```

The version of `\@currdir` in `texsys.cfg` looks OK.

```

170 \fi

```

```

171 \immediate\closeout15 %
172 \endgroup
173 \typeout{^^J^^J%
174   \noexpand\@currdir set to:
175   \expandafter\strip@prefix\meaning\@currdir.^^J%
176 }

```

Stop here if the file is being used unstripped.

```

177 <*docstrip>
178 \relax\endinput
179 </docstrip>

```

5 Setting `\input@path`

Earlier versions of this file attempted to automatically test whether `\input@path` was required, and interactively prompt for a path if necessary. This was not found to be very reliable. The first-time installer of L^AT_EX 2 _{ε} can not be expected to have enough information to supply the correct information to the prompts. Now the interaction is omitted. After the format is made the installer can attempt to run the test document `ltxcheck.tex` through L^AT_EX 2 _{ε} . This will check, amongst other things, whether `texsys.cfg` will need to be edited and the format remade.

`\input@path` Now set up the `\input@path`.

`\input@path` should either be undefined, or a list of directories as described in the introduction.

```

180 \typeout{^^J%
181   Assuming \noexpand\openin and \noexpand\input^^J%
182   \ifx\input@path\@undefined

```

```

\input@path has not been pre-defined.

183      have the same search path.^~J%
184      \else
185          \input@path has been defined in texsys.cfg.
186          have different search paths.^~J%
187          LaTeX will use the path specified by \noexpand\input@path:^~J%
188      \fi
189 }

```

6 Filename Parsing

\filename@parse Split a filename into its components.

```

189 \ifx\filename@parse\@undefined
190   \def\reserved@a{./}\ifx\@currdir\reserved@a

200         \def\reserved@a{\filename@simple#1.\@}%
201       \else
202         \edef\filename@area{\filename@area#1/}%
203         \def\reserved@a{\filename@path#2\@}%
204       \fi
205     \reserved@a}
206   \else\def\reserved@a{}{}\ifx\@currdir\reserved@a
207     \filename@parse was not specified in texsys.cfg, but \@currdir looks like
208     VMS...
209     \typeout{^^JDefining VMS style filename parser.^~J}
210     \def\filename@parse#1{%
211       \let\filename@area\@empty
212       \expandafter\filename@path#1\@}
213     Search for the last ].
214     \def\filename@path#1]#2\@{%
215       \ifx\@#2\@%
216         \def\reserved@a{\filename@simple#1.\@}%
217       \else
218         \edef\filename@area{\filename@area#1}]%}
219         \def\reserved@a{\filename@path#2\@}%
220       \fi
221     \reserved@a}
222   \else\def\reserved@a{}{}\ifx\@currdir\reserved@a

```

```
\filename@parse was not specified in texsys.cfg, but \@currdir looks like Macintosh...
```

```
217   \typeout{^^JDefining Mac style filename parser.^^J}
218   \def\filename@parse#1{%
219     \let\filename@area\empty
220     \expandafter\filename@path#1:\\}
```

Search for the last ::

```
221   \def\filename@path#1:#2\\{%
222     \ifx\\#2\\%
223       \def\reserved@a{\filename@simple#1:\\}%
224     \else
225       \edef\filename@area{\filename@area#1:}%
226       \def\reserved@a{\filename@path#2\\}%
227     \fi
228     \reserved@a}
229 \else
```

```
\filename@parse was not specified in texsys.cfg. So just make a simple parser that always sets \filename@area to empty.
```

```
230   \typeout{^^JDefining generic filename parser.^^J}
231   \def\filename@parse#1{%
232     \let\filename@area\empty
233     \expandafter\filename@simple#1:\\}
234 \fi\fi\fi
```

\filename@simple is used by all three versions. Finally we can split off the extension.

```
235   \def\filename@simple#1.#2\\{%
236     \ifx\\#2\\%
237       \let\filename@ext\relax
238     \else
239       \edef\filename@ext{\filename@dot#2\\}%
240     \fi
241     \edef\filename@base{\#1}}
```

Remove a final dot, added earlier.

```
242   \def\filename@dot#1.\\{\#1}
243 \else
```

Otherwise, \filename@parse was specified in **texsys.cfg**.

```
244   \typeout{^^J^^J}
245   \noexpand\filename@parse was defined in texsys.cfg:^^J%
246   \expandafter\strip@prefix\meaning\filename@parse.^^J%
247 }
248 \fi
```

7 TEX Versions

\@TeXversion TEX versions older than than 3.141 require \@TeXversion to be set. This can be determined automatically due to a trick suggested by Bernd Raichle. (Actually this will not always get the correct version number, eg TeX3.14 would be detected

as T_EX3, but L^AT_EX only needs to take account of T_EX's older than 3, or between 3 and 3.14.

```
249 \ifx\@TeXversion\@undefined
250   \ifx\@undefined\inputlineno
251     \def\@TeXversion{2}
252   \else
253     {\catcode`\^=active
254      \def\reserved@a#1#2\@{\if#1\string`#3\fi}
255      \edef\reserved@a{\expandafter\reserved@a\string`#1\@}
256      \ifx\reserved@a\empty\else\gdef\@TeXversion{3}\fi}
257   \fi
258 \fi
259 </dircheck>
```

8 ltxcheck.tex

After the format has been made, and article.cls moved with the other files to the 'standard input directory' as specified in `install.txt`, the format may be checked by running the file `ltxcheck.tex`.

File b

ltplain.dtx

9 Plain T_EX

L^AT_EX includes almost all of the functionality of Knuth's original 'Basic Macros'. That is, the plain T_EX format described in Appendix B of the T_EXBook. However, some of the user commands are not much use so, in order to save memory, we may remove them from the kernel into a package. Here is a list of the commands that may be removed (PROBABLY NOT COMPLETE).

```
\magstep    \magstephalf  
\mathhexbox  
\vglue     \vgl@  
\hglue     \hgl@
```

This file is by now very small as most of it has been moved to more appropriate kernel files: it may disappear completely one day.

L^AT_EX font definitions are done using NFSS2 so none of PLAIN's font definitions are in L^AT_EX.

L^AT_EX has its own tabbing environment, so PLAIN's is disabled.

L^AT_EX uses its own output routine, so most of the plain one was removed.

```
1 {*ekernel | autoload}  
2 \catcode`{\=1 % left brace is begin-group character  
3 \catcode`{\}=2 % right brace is end-group character  
4 \catcode`\$=3 % dollar sign is math shift  
5 \catcode`\&=4 % ampersand is alignment tab  
6 \catcode`\#=6 % hash mark is macro parameter character  
7 \catcode`\^=7 % circumflex and uparrow are for superscripts  
8 \catcode`\_=8 % underline and downarrow are for subscripts  
9 \catcode`\^^I=10 % ascii tab is a blank space  
10 \chardef\active=13 \catcode`\~=\\active % tilde is active  
11 \catcode`\^^L=\\active \outer\def\active{\\par}% ascii form-feed is \\par  
12 \message{catcodes,}
```

We had to define the \catcodes right away, before the message line, since \message uses the { and } characters. When INITEX (the T_EX initializer) starts up, it has defined the following \catcode values:

```
\catcode`\^^@=9 % ascii null is ignored  
\catcode`\^M=5 % ascii return is end-line  
\catcode`\|=0 % backslash is TeX escape character  
\catcode`\%14 % percent sign is comment character  
\catcode`\ =10 % ascii space is blank space  
\catcode`\^^?=15 % ascii delete is invalid  
\catcode`\A=11 ... \catcode`\Z=11 % uppercase letters  
\catcode`\a=11 ... \catcode`\z=11 % lowercase letters  
all others are type 12 (other)
```

Here is a list of the characters that have been specially catcoded:

```
13 \def\dospecials{\do\ \do\\\do\{\do\}\do\$\\do\&%  
14 \do\#\do\^\do\_\\do\%\do\~}
```

(not counting ascii null, tab, linefeed, formfeed, return, delete) Each symbol in the list is preceded by , which can be defined if you want to do something to every item in the list.

We make @ signs act like letters, temporarily, to avoid conflict between user names and internal control sequences of plain format.

15 \catcode`@=11

To make the plain macros more efficient in time and space, several constant values are declared here as control sequences. If they were changed, anything could happen; so they are private symbols.

\one Small constants are defined using \chardef.

\tw@ 16 \chardef\one=1

\thr@@ 17 \chardef\tw@=2

\@M 22 \mathchardef\@m=1000

\@MM 23 \mathchardef\@M=10000

24 \mathchardef\@MM=20000

Allocation of registers

Here are macros for the automatic allocation of \count, \box, \dimen, \skip, \muskip, and \toks registers, as well as \read and \write stream numbers, \fam codes, \language codes, and \insert numbers.

25 \message{registers,}

When a register is used only temporarily, it need not be allocated; grouping can be used, making the value previously in the register return after the close of the group. The main use of these macros is for registers that are defined by one macro and used by others, possibly at different nesting levels. All such registers should be defined through these macros; otherwise conflicts may occur, especially when two or more macro packages are being used at the same time.

The following counters are reserved:

0 to 9 page numbering

10 count allocation

11 dimen allocation

12 skip allocation

13 muskip allocation

14 box allocation

15 toks allocation

16 read file allocation

17 write file allocation

18 math family allocation

19 language allocation

20 insert allocation

21 the most recently allocated number

22 constant -1

New counters are allocated starting with 23, 24, etc. Other registers are allocated starting with 10. This leaves 0 through 9 for the user to play with safely, except that counts 0 to 9 are considered to be the page and subpage numbers (since they are displayed during output). In this scheme, `\count` 10 always contains the number of the highest-numbered counter that has been allocated, `\count` 14 the highest-numbered box, etc. Inserts are given numbers 254, 253, etc., since they require a `\count`, `\dimen`, `\skip`, and `\box` all with the same number; `\count` 20 contains the lowest-numbered insert that has been allocated. Of course, `\box255` is reserved for `\output`; `\count255`, `\dimen255`, and `\skip255` can be used freely.

It is recommended that macro designers always use `\global` assignments with respect to registers numbered

1, 3, 5, 7, 9,

and always non-`\global` assignments with respect to registers

0, 2, 4, 6, 8, 255.

This will prevent “save stack buildup” that might otherwise occur.

```

26 \count10=22 % allocates \count registers 23, 24, ...
27 \count11=9 % allocates \dimen registers 10, 11, ...
28 \count12=9 % allocates \skip registers 10, 11, ...
29 \count13=9 % allocates \muskip registers 10, 11, ...
30 \count14=9 % allocates \box registers 10, 11, ...
31 \count15=9 % allocates \toks registers 10, 11, ...
32 \count16=-1 % allocates input streams 0, 1, ...
33 \count17=-1 % allocates output streams 0, 1, ...
34 \count18=3 % allocates math families 4, 5, ...
35 \count19=0 % allocates \language codes 1, 2, ...
36 \count20=255 % allocates insertions 254, 253, ...

```

`\insc@unt` The insertion counter and most recent allocation.

`\allocationnumber` 37 `\countdef\insc@unt=20`
38 `\countdef\allocationnumber=21`

`\m@ne` The constant -1 .

39 `\countdef\m@ne=22 \m@ne=-1`

`\wlog` Write on log file (only)

40 `\def\wlog{\immediate\write\m@ne}`

`\count@` Here are abbreviations for the names of scratch registers that don't need to be allocated.

`\dimen@` 41 `\countdef\count@=255`

`\dimen@ii` 42 `\dimendef\dimen@=0`

`\skip@` 43 `\dimendef\dimen@i=1 % global only`

`\toks@` 44 `\dimendef\dimen@ii=2`

45 `\skipdef\skip@=0`

46 `\toksdef\toks@=0`

`\newcount` Now, we define `\newcount`, `\newbox`, etc. so that you can say `\newcount\foo` and `\foo` will be defined (with `\countdef`) to be the next counter.

To find out which counter `\foo` is, you can look at `\allocationnumber`.

`\newskip` Since there's no `\boxdef` command, `\chardef` is used to define a `\newbox`, `\newinsert`, `\newfam`, and so on.

`\newbox`

`\newfam`

`\newinsert`

`\newskip`

`\toksdef`

226 \def\ooalign{\lineskip\z@ -\maxdimen \oalign}

```

```

\sh@ft
227 \def\sh@ft#1{\dimen@.00#1ex\multiply\dimen@\fontdimen1\font
228   \kern-.0156\dimen@} % compensate for slant in lowered accents

    LATEX change: \d, \b, \c, \copyright, \TeX defined elsewhere.
    LATEX change: Make \t work in a moving argument. Now defined elsewhere.

\hrulefill LATEX change: \kern\z@ added to end of \hrulefill and \dotfill to make them
\dotfill work in ‘tabular’ and ‘array’ environments. (Change made 24 July 1987). LATEX
change: \leavevmode added at begining of \dotfill and \hrulefill so that
they work as expected in vertical mode.
229 \def\hrulefill{\leavevmode\leaders\hrule\hfill\kern\z@}

The box in \dotfill originally contained (in plain.tex): \mkern 1.5mu .\mkern 1.5mu;
the width of .44em differs from this by .04pt which is probably an acceptable dif-
ference within leaders.
230 \def\dotfill{%
231   \leavevmode
232   \leaders \hb@xt@ .44em{\hss.\hss}\hfill
233   \kern\z@}

INITEX sets \sfcode x=1000 for all x, except that \sfcode‘X=999 for upper-
case letters. The following changes are needed:
234 \sfcode‘\)=0 \sfcode‘\’=0 \sfcode‘\]=0

The \nonfrenchspacing macro will make further changes to \sfcode values.
Definitions related to output
\magnification doesn't work in LATEX.

\def\magnification{\afterassignment\m@g\count@}
\def\m@g{\mag\count@
  \hsize6.5truein\vsize8.9truein\dimen\footins8truein}

\showoverfull The following commands are used in debugging:
235 \def\showoverfull{\tracingonline\@ne}

\showoutput
\loggingoutput 236 </2ekernel | autoload>
237 <*2ekernel | autoerr>
238 \gdef\loggingoutput{\tracingoutput\@ne
239   \showboxbreadth\maxdimen\showboxdepth\maxdimen\errorstopmode}
240 \gdef\showoutput{\loggingoutput\showoverfull}
241 </2ekernel | autoerr>
242 <autoload>\def\showoutput{\@autoerr\showoutput}

\tracingall
\loggingall 243 <*2ekernel | autoerr>
244 \gdef\loggingall{\tracingcommands\tw@\tracingstats\tw@
245   \tracingpages\@ne\tracinglostchars\@ne
246   \tracingmacros\tw@\tracingparagraphs\@ne\tracingrestores\@ne
247   \errorcontextlines\maxdimen\loggingoutput}
248 \gdef\tracingall{\loggingall\showoverfull}
249 </2ekernel | autoerr>
250 <autoload>\def\tracingall{\@autoerr\tracingall}

```

LATEX change: \showhyphens Defined later.
Punctuation affects the spacing.

251 ⟨*2ekernel | autoload⟩
252 \nonfrenchspacing
253 ⟨/2ekernel | autoload⟩

File c ltvers.dtx

10 Version Identification

First we identify the date and version number of this release of L^AT_EX, and set `\everyjob` so that it is printed at the start of every L^AT_EX run.

```
1 \fmtname
\fmtversion 1 {*2ekernel}
2 \def\fmtname{LaTeX2e}
3 \edef\fmtversion{2003/12/01}
```

Check that the format being made is not too old. The error message complains about ‘more than 5 years’ but in fact the error is not triggered until 65 months.

This code is currently not activated as we don’t know if we already got to the last official 2e version (due to staff shortage or due to a successor (think positive:-))).

```
4 \iftrue
5 \def\reserved@a{\#1/#2/#3@nil{%
6   \count@\year
7   \advance\count@-#1\relax
8   \multiply\count@ by 12\relax
9   \advance\count@\month
10  \advance\count@-#2\relax}
11 \expandafter\reserved@a\fmtversion\@nil
```

`\count@` is now the age of this file in months. Take a generous definition of ‘year’ so this message is not generated too often.

```
12 \ifnum\count@>65
13   \typeout{^^J%
14 !!!!!!! You are attempting to make a LaTeX format from a source file^^J%
15 ! That is more than five years old.^^J%
16 ! ^^^J%
17 ! ^^^J%
18 ! If you enter <return> to scroll past this message then the format^^J%
19 ! will be built, but please consider obtaining newer source files^^J%
20 ! before continuing to build LaTeX.^^J%
21 !!!!!!! ^^^J%
22 }
23   \errhelp{To avoid this error message, obtain new LaTeX sources.}
24   \errmessage{LaTeX source files more than 5 years old!}
25 \fi
26 \let\reserved@a\relax
27 \fi
```

This startup banner may be further modified by the code in `ltfinal.dtx` if a patch file is present.

```
28 \everyjob{\typeout{\fmtname
29 {autoload}\space(autoload version)%
30                                     \space<\fmtversion>}}
31 \immediate\write16{\fmtname
```

```
32 <autoload>\space(autoload version)%  
33                                     \space<\fmtversion>}  
34 </2ekernel>
```

File d

ltdefns.dtx

11 Definitions

This section contains commands used in defining other macros.

1 ⟨*2ekernel⟩

11.1 Initex initialisations

\two@digits Prefix a number less than 10 with ‘0’.

2 \def\two@digits#1{\ifnum#1<10 0\fi\number#1}

\typeout Display something on the terminal.

3 \def\typeout#1{\begingroup\set@display@protect
4 \immediate\write\@unused{#1}\endgroup}

\newlinechar A char to be used as new-line in output to files.

5 \newlinechar'\\^J

11.2 Saved versions of TeX primitives

The TeX primitive \foo is saved as \@@foo. The following primitives are handled in this way:

\@@par

6 \let\@@par=\par
7 %\let\@@input=\input %%% moved earlier
8 %\let\@@end=\end %%%

\@@hyph The following comment was added when these commands were first set up, 19
 `- April 1986: the \- command is redefined to allow it to work in the \ttfamily
type style, where automatic hyphenation is suppressed by setting \hyphenchar
to -1. The original primitive TeX definition is saved as \@@hyph just in case
anyone needs it.

There is a need for a robust command for a discretionary hyphen since its exact representation depends on the glyphs available in the current font. For example, with suitable fonts and the T1 font encoding it is possible to use hanging hyphens.

A suitable robust definition that allows for many possible types of font and encoding may be as follows:

```
\DeclareRobustCommand {\-}{%
  \discretionary {%
    \char \ifnum\hyphenchar\font<\z@
      \defaulthyphenchar
    \else
      \hyphenchar\font
    \fi
  }{}{}}
```

```
}
```

The redefinition (via `\let`) of `\-` within tabbing also makes the use of a robust command advisable since then any redefinition of `\-` via `\DeclareRobustCommand` will not cause a conflict.

Therefore, macro writers should be hereby warned that these internals will probably change! It is likely that a future release of L^AT_EX will make `\-` effectively an encoding specific text command.

```
9 \let\@@hyph=\-          % Save original primitive definition
10 \def\-\{\discretionary{-}{ }{ }{ }
```

`\@dischyp`

```
11 \let\@dischyp=\-
```

`\@italiccorr` Save the original italic correction.

```
12 \let\@italiccorr=\/
```

`\@height` The following definitions save token space. E.g., using `\@height` instead of `height` saves 5 tokens at the cost in time of one macro expansion.

`\@depth` `13 \def\@height{height} \def\@depth{depth} \def\@width{width}`

`\@minus` `14 \def\@minus{minus}`

`\@plus` `15 \def\@plus{plus}`

`\hb@xt@` The next one is another 100 tokens worth.

```
16 \def\hb@xt@{\hbox to}
```

```
17 \message{hacks, }
```

11.3 Command definitions

This section defines the following commands:

`\@namedef` `{(NAME)}`

Expands to `\def\{(NAME)\}`, except name can contain any characters.

`\@nameuse` `{(NAME)}`

Expands to `\{(NAME)\}`.

`\@ifnextchar` `X{(YES)}{(NO)}`

Expands to `(YES)` if next character is an ‘X’, and to `(NO)` otherwise. (Uses `\reserved@a-\reserved@c.`) NOTE: GOBBLES ANY SPACE FOLLOWING IT.

`\@ifstar` `{(YES)}{(NO)}`

Gobbles following spaces and then tests if next the character is a ‘*’. If it is, then it gobbles the ‘*’ and expands to `(YES)`, otherwise it expands to `(NO)`.

`\@dblarg` `{(CMD)}{(ARG)}`

Expands to `\{(CMD)\}[{ARG}]{(ARG)}`. Use `\@dblarg\CS` when `\CS` takes arguments `[ARG1]{ARG2}`, where default is `ARG1 = ARG2`.

`\@ifundefined` `{(NAME)}{(YES)}{(NO)}`

: If `\NAME` is undefined then it executes `(YES)`, otherwise it executes `(NO)`. More precisely, true if `\NAME` either undefined or = `\relax`.

`\@ifdefinable` `\NAME{(YES)}` Executes `(YES)` if the user is allowed to define `\NAME`, otherwise it gives an error. The user can define `\NAME` if `\@ifundefined{NAME}` is true, ‘NAME’

\neq 'relax' and the first three letters of 'NAME' are not 'end', and if \endNAME is not defined.

\newcommand $*{(\text{\FOO})}[(i)]{(\text{TEXT})}$
User command to define \FOO to be a macro with i arguments (i = 0 if missing) having the definition TEXT . Produces an error if \FOO already defined.
Normally the command is defined to be \long (ie it may take multiple paragraphs in its argument). In the star-form, the command is not defined as \long and a blank line in any argument to the command would generate an error.

\renewcommand Same as \newcommand, except it checks if \FOO already defined.

\newenvironment $*{(\text{FOO})}[(i)]{(\text{DEF1})}{(\text{DEF2})}$
equivalent to:
\newcommand{\FOO}[i]{\def{\endFOO}{\text{DEF2}}}
(or the appropriate star forms).

\renewenvironment Obvious companion to \newenvironment.
\@cons : See description of \output routine.
\@car \car T1 T2 ... \nil == T1 (unexpanded)
\@cdr \cdr T1 T2 ... \nil == T2 ... \nil (unexpanded)
\typeout \{message\}
Produces a warning message on the terminal.

\typein \{message\}
Types message, asks the user to type in a command, then executes it
\typein [(\text{\CS})]{(\text{MSG})}
Same as above, except defines \CS to be the input instead of executing it.

\typein
18 \def\typein{%
19 \let\@typein\relax
20 \@testopt\@xtypein\@typein}

21 \def\@xtypein[#1]#2{%
22 \typeout{#2}%
23 \advance\endlinechar\@M
24 \read\@inputcheck to#1%
25 \advance\endlinechar-\@M
26 \@typein}

\@namedef
27 \def\@namedef#1{\expandafter\def\csname #1\endcsname}

\@nameuse
28 \def\@nameuse#1{\csname #1\endcsname}

\@cons
29 \def\@cons#1#2{\begingroup\let\@elt\relax\xdef#1{\@elt #2}\endgroup}

\@car
\@cdr 30 \def\@car#1#2{\nil{#1}}
31 \def\@cdr#1#2{\nil{#2}}

```

\@carcube \@carcube T1 ... Tn\@nil = T1 T2 T3 , n > 3
32 \def\@carcube#1#2#3#4\@nil{#1#2#3}

\@onlypreamble This macro adds its argument to the list of commands stored in \preamblecmds
\preamblecmds to be disabled after \begin{document}. These commands are redefined to generate \notprerr at this point.
33 \def\preamblecmds{}
34 \def\@onlypreamble#1{%
35   \expandafter\gdef\expandafter\preamblecmds\expandafter{%
36     \preamblecmds\do#1}%
37 \@onlypreamble\@onlypreamble
38 \@onlypreamble\preamblecmds

\@star@or@long Look ahead for a *. If present reset \l@ngrel@x so that the next definition, #1,
will be non-long.
39 \def\@star@or@long#1{%
40   \@ifstar
41   {\let\l@ngrel@x\relax#1}%
42   {\let\l@ngrel@x\long#1}%

\l@ngrel@x This is either \relax or \long depending on whether the *-form of a definition
command is being executed.
43 \let\l@ngrel@x\relax

\newcommand User level \newcommand.
44 \def\newcommand{\@star@or@long\new@command}

\new@command
45 \def\new@command#1{%
46   \@testopt{\@newcommand#1}0}

49     {\@argdef#1[#2]}}}

Define #1 if it is definable.
Both here and in \xargdef the replacement text is absorbed as an argument
because this removes any space-token that may appear after the optional
argument(s).
50 \long\def\@argdef#1[#2]#3{%
51   \@ifdefinable #1{\@yargdef#1\@ne{[#2]}{#3}}}

Handle the second optional argument.
52 \long\def\@xargdef#1[#2][#3]#4{%
53   \@ifdefinable#1{%

Define the actual command to be:
\def\foo{\@protected@testopt\foo\\foo{default}}
where \\foo is a csname generated from applying \csname and \string to \foo, ie
the actual name contains a backslash and therefore can't clash easily with existing
command names. "Default" is the contents of the second optional argument of
(re)newcommand.

```

The `\aut@global` command below is only used in the autoload format. If it is `\global` then a global definition will be made.

```
54 {autoload}\aut@global
55     \expandafter\def\expandafter#1\expandafter{%
56         \expandafter
57         \@protected@testopt
58         \expandafter
59         #1%
60         \csname\string#1\endcsname
61         {#3}}%
```

Now we define the internal macro ie `\\\foo` which is supposed to pick up all arguments (optional and mandatory).

```
62     \expandafter\@yargdef
63         \csname\string#1\endcsname
64         \tw@
65         {#2}%
66         {#4}}}
```

`\@testopt` This macro encapsulates the most common call to `\@ifnextchar`, saving several tokens each time it is used in the definition of a command with an optional argument. #1 The code to execute in the case that there is a [need not be a single token but can be any sequence of commands that ‘expects’ to be followed by [. If this command were only used in `\newcommand` definitions then #1 would be a single token and the braces could be omitted from {#1} in the definition below, saving a bit of memory.

```
67 \long\def\@testopt#1#2{%
68   \kernel@ifnextchar[{#1}{#1[{#2}]}}
```

`\@protected@testopt` Robust version of `\@testopt`. The extra argument (#1) must be a single token. If protection is needed the call expands to `\protect` applied to this token, and the 2nd and 3rd arguments are discarded (by `\@x@protect`). Otherwise `\@testopt` is called on the 2nd and 3rd arguments.

This method of making commands robust avoids the need for using up two csnames per command, the price is the extra expansion time for the `\ifx` test.

```
69 \def\@protected@testopt#1{%%
70   \ifx\protect\@typeset@protect
71     \expandafter\@testopt
72   \else
73     \@x@protect#1%
74   \fi}
```

`\@yargdef` These generate a primitive argument specification, from a L^AT_EX [*digit*] form; in fact *digit* can be anything such that `\number` *digit* is single digit.

Reorganised slightly so that `\renewcommand{\reserved@a}[1]{foo}` works. I am not sure this is worth it, as a following `\newcommand` would over-write the definition of `\reserved@a`.

Recall that L^AT_EX2.09 goes into an infinite loop with `\renewcommand[1]{\@tempa}{foo}` (DPC 6 October 93).

Reorganised again (DPC 1999). Rather than make a loop to construct the argument spec by counting, just extract the required argument spec by using a delimited argument (delimited by the digit). This is faster and uses less tokens.

The coding is slightly odd to preserve the old interface (using #2 = `\tw@` as the flag to surround the first argument with `[]`). But the new method did not allow for the number of arguments #3 not being given as an explicit digit; hence (further expansion of this argument and use of) `\number` was added later in 1999.

It is not clear why these are still `\long`.

```
75 \long \def \@yargdef #1#2#3{%
76   \ifx#2\tw@
77     \def\reserved@b##1{[####1]}%
78   \else
79     \let\reserved@b\@gobble
80   \fi
81   \expandafter
82   \@yargd@f \expandafter{\number #3}#1%
83 }
```

The `\aut@global` command below is only used in the autoload format. If it is `\global` then a global definition will be made.

```
84 \long \def \@yargd@f#1#2{%
85   \def \reserved@a ##1##2##{%
86   <autoload>\aut@global
87     \expandafter\def\expandafter#2\reserved@b ##1#1%
88   }%
89   \l@ngrel@x \reserved@a 0##1##2##3##4##5##6##7##8##9##1%
90 }
```

```
\@reargdef
91 \long\def\@reargdef#1[#2]{%
92   \@yargdef#1\@ne{#2}}
```

`\renewcommand` Check the command name is already used. If not give an error message. Then temporarily disable `\@ifdefinable` then call `\newcommand`. (Previous version `\let#1=\relax` but this does not work too well if #1 is `\@tempa-e`.)

```
93 \def\renewcommand{\@star@or@long\renew@command}
```

`\renew@command`

```
94 \def\renew@command#1{%

\@backslashchar A category code 12 backslash.
191 \edef\@backslashchar{\expandafter\gobble\string\\}

```

11.4 Robust commands and protect

Fragile and robust commands are one of the thornier issues in L^AT_EX's commands. Whilst typesetting documents, L^AT_EX makes use of many of T_EX's features, such as arithmetic, defining macros, and setting variables. However, there are (at least) three different occasions when these commands are not safe. These are called 'moving arguments' by L^AT_EX, and consist of:

- writing information to a file, such as indexes or tables of contents.
- writing information to the screen.
- inside an \edef, \message, \mark, or other command which evaluates its argument fully.

The method L^AT_EX uses for making fragile commands robust is to precede them with \protect. This can have one of five possible values:

- \relax, for normal typesetting. So \protect\foo will execute \foo.
- \string, for writing to the screen. So \protect\foo will write \foo.
- \noexpand, for writing to a file. So \protect\foo will write \foo followed by a space.
- \@unexpandable@protect, for writing a moving argument to a file. So \protect\foo will write \protect\foo followed by a space. This value is also used inside \edefs, \marks and other commands which evaluate their arguments fully.
- \@unexpandable@noexpand, for performing a deferred write inside an \edef. So \protect\foo will write \foo followed by a space. If you want \protect\foo to be written, you should use \@unexpandable@protect. (Removed as never used).

\@unexpandable@protect These commands are used for setting \protect inside \edefs.

\@unexpandable@noexpand
192 \def\@unexpandable@protect{\noexpand\protect\noexpand}
193 %\def\@unexpandable@noexpand{\noexpand\noexpand\noexpand}

\DeclareRobustCommand
\declare@robustcommand This is a package-writers command, which has the same syntax as \newcommand, but which declares a protected command. It does this by having

\DeclareRobustCommand\foo
define \foo to be \protect\foo<space>,
and then use \newcommand\foo<space>.

Since the internal command is \foo<space>, when it is written to an auxiliary file, it will appear as \foo.

We have to be a bit cleverer if we're defining a short command, such as _, in order to make sure that the auxiliary file does not include a space after the command, since _ a and _a aren't the same. In this case we define _ to be:

\x@protect_ \protect__<space>

which expands to:

```
\ifx\protect\@typeset@protect\else
  \x@protect@\_
\fi
\protect\_<space>
```

Then if `\protect` is `\@typeset@protect` (normally `\relax`) then we just perform `_<space>`, and otherwise `\x@protect@` gobbles everything up and expands to `\protect_`.

Note: setting `\protect` to any value other than `\relax` whilst in ‘typesetting’ mode will cause commands to go into an infinite loop! In particular, setting `\relax` to `\empty` will cause `_` to loop forever. It will also break lots of other things, such as protected `\ifmmodes` inside `\haligns`. If you really really have to do such a thing, then please set `\@typeset@protect` to be `\empty` as well. (This is what the code for `\patterns` does, for example.)

More fun with `\expandafter` and `\csname`.

```
194 \def\DeclareRobustCommand{\@star@or@long\declare@robustcommand}
195 \def\declare@robustcommand#1{%
196   \ifx#1\undefined\else\ifx#1\relax\else

```

11.5 Internal defining commands

These commands are used internally to define other L^AT_EX commands.

```

\@ifundefined Check if first arg is undefined or \relax and execute second or third arg depending,
245 \def\@ifundefined#1{%
246   \expandafter\ifx\csname#1\endcsname\relax
247   \expandafter\@firstoftwo
248   \else
249   \expandafter\@secondoftwo
250   \fi}

\@qend The following define \@qend and \@qrelax to be the strings ‘end’ and ‘relax’
\@qrelax with the characters \catcode 12.
251 \edef\@qend{\expandafter\@cdr\string\end\@nil}
252 \edef\@qrelax{\expandafter\@cdr\string\relax\@nil}

\@ifnextchar \@ifnextchar peeks at the following character and compares it with its first argument. If both are the same it executes its second argument, otherwise its third.
253 \long\def\@ifnextchar#1#2#3{%
254   \let\reserved@d=#1%
255   \def\reserved@a{#2}%
256   \def\reserved@b{#3}%
257   \futurelet\@let@token\@ifnch}

```

\kernel@ifnextchar	This macro is the kernel version of \ifnextchar which is used in a couple of places to prevent the AMS variant from being used since in some places this produced chaos (for example if an fd file is loaded in a random place then the optional argument to \ProvidesFile could get printed there instead of being written only in the log file. This happened when there was a space or a newline between the mandatory and optional arguments! It should really be fixed in the amsmath package one day, but...
	Note that there may be other places in the kernel where this version should be used rather than the original, but variable, version.
258 \let\kernel@ifnextchar\@ifnextchar	
\@ifnch	\@ifnch is a tricky macro to skip any space tokens that may appear before the character in question. If it encounters a space token, it calls xifnch.
259 \def\@ifnch{%	
260 \ifx\@let@token\@sptoken	
261 \let\reserved@c\@xifnch	
262 \else	
263 \ifx\@let@token\reserved@d	
264 \let\reserved@c\reserved@a	
265 \else	
266 \let\reserved@c\reserved@b	
267 \fi	
268 \fi	
269 \reserved@c}	
\@sptoken	The following code makes \@sptoken a space token. It is important here that the control sequence \: consists of a non-letter only, so that the following whitespace is significant. Together with the fact that the equal sign in a \let may be followed by only one optional space the desired effect is achieved. NOTE: the following hacking must precede the definition of \: as math medium space.
270 \def\:{\let\@sptoken= } \: % this makes \@sptoken a space token	
\@xifnch	In the following definition of \@xifnch, \: is again used to get a space token as delimiter into the definition.
271 \def\:{\@xifnch} \expandafter\def\:{\futurelet\@let@token\@ifnch}	
\makeatletter	Make internal control sequences accessible or inaccessible.
\makeatother	272 \def\makeatletter{\catcode`@11\relax}
	273 \def\makeatother{\catcode`@12\relax}
\@ifstar	The new implementation below avoids passing the <i>true code</i> Through one more \def than the <i>false code</i> , which previously meant that # had to be written as ##### in one argument, but ## in the other. The * is gobbled by \@firstoftwo.
274 \def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}{}}	
\@dblarg	
\@dblarg	275 \long\def\@dblarg#1{\kernel@ifnextchar[{\#1}{\@dblarg{#1}}]}
	276 \long\def\@dblarg#1#2[#1][{\#2}]{#2}}

\@sanitize The command `\@sanitize` changes the catcode of all special characters except for braces to ‘other’. It can be used for commands like `\index` that want to write their arguments verbatim. Needless to say, this command should only be executed within a group, or chaos will ensue.

```
277 \def\@sanitize{\@makeother\ \@makeother\\@makeother\$@makeother\&%
278 @makeother\#\@makeother\^@makeother\_@makeother\%@makeother\~}
```

\@onellevel@sanitize This makes the whole “meaning” of #1 (its one-level expansion) into catcode 12 tokens: it could be used in `\DeclareRobustCommand`.

If it is to be used on default float specifiers, this should be done when they are defined.

```
279 \def \@onellevel@sanitize #1{%
280   \edef #1{\expandafter\strip@prefix
281           \meaning #1}%
282 }
```

```
283 </2ekernel>
```

11.6 Commands for Autoloading

```
284 <*autoload>
```

\aut@global This command is only defined in the ‘autoload’ format. It is normally `\relax` but may be set to `\global`, in which case `\newif` and the commands based on `\newcommand` will all make global definitions.

```
285 \let\aut@global\relax
```

\@autoload This macro is only defined in the ‘autoload’ format. It inputs a package ‘auto#1.sty’ within a local group, and with normalised catcodes. `\aut@global` is set to `\global` so that `\newif` `\newcommand` and related commands make global definitions.

```
286 \def\@autoload#1{%
287   \begingroup
288   \makeatletter
289   \let\aut@global\global
290   \nfss@catcodes
291   \catcode`\ =10
292   \let\@latex@error@gobble
293   \@@input auto#1.sty\relax
294   \endgroup}
```

```
295 </autoload>
```

13 Program control structure

This section defines a number of control structure macros, such as while-loops and for-loops.

```
1 <*2ekernel>
2 \message{control,}

\@whilenum TEST \do {BODY}
\@whiledim TEST \do {BODY} : These implement the loop
    while TEST do BODY od
    where TEST is a TeX \ifnum or \ifdim test, respectively.
    They are optimized for the normal case of TEST initially false.

\@whilesw SWITCH \fi {BODY} : Implements the loop
    while SWITCH do BODY od
    Optimized for normal case of SWITCH initially false.

\@for NAME := LIST \do {BODY} : Assumes that LIST expands to
A1,A2,
    ... ,An .
    Executes BODY n times, with NAME = Ai on the i-th
iteration.
    Optimized for the normal case of n = 1. Works for n=0.

\@tfour NAME := LIST \do {BODY}
    if, before expansion, LIST = T1 ... Tn where each Ti is a
    token or {...}, then executes BODY n times, with NAME = Ti
    on the i-th iteration. Works for n=0.
```

NOTES: 1. These macros use no \@temp sequences.
2. These macros do not work if the body contains anything that looks syntactically to TeX like an improperly balanced \if \else \fi.

```
\@whilenum TEST \do {BODY} ==
BEGIN
    if TEST
        then BODY
            \@iwhilenum{TEST \relax BODY}
END

14 Error handling

This section defines L^AT_EX's error commands.

The '2ekernel' code ensures that a \usepackage{autoerr} is essentially ignored if a 'full' format is being used that has the error messages already in the format.

```
1 <2ekernel>\expandafter\let\csname ver@autoerr.sty\endcsname\fmtversion
2 (*2ekernel | autoload)
```

14.1 General commands

\MessageBreak	This command prints a new-line inside a message, followed by a continuation line begun with \msg@continuation. Normally it is defined to be \relax, but inside messages, it is let to \message@break. 3 \let\MessageBreak\relax
\GenericInfo	This takes two arguments: a continuation and a message, and sends the result to the log file. 4 \DeclareRobustCommand{\GenericInfo}[2]{% 5 \begingroup 6 \def\MessageBreak{^^J#1}% 7 \set@display@protect 8 \immediate\write\m@ne{#2\on@line.}% 9 \endgroup 10 }
\GenericWarning	This takes two arguments: a continuation and a message, and sends the result to the screen. 11 \DeclareRobustCommand{\GenericWarning}[2]{% 12 \begingroup 13 \def\MessageBreak{^^J#1}% 14 \set@display@protect 15 \immediate\write\@unused{^^J#2\on@line.^^J}% 16 \endgroup 17 } 18 </2ekernel autoload>
\GenericError	This macro takes four arguments: a continuation, an error message, where to go for further information, and the help information. It displays the error message, and sets the error help (the result of typing h to the prompt), and does a horrible hack to turn the last context line (which by default is the only context line) into just three dots. This could be made more efficient. 19 <autoload>\def\GenericError{\@autoerr\GenericError} 20 (*2ekernel def) 21 \bgroup 22 \lccode`@='`%

```

23 \lccode`~`\ %
24 \lccode`\}`\ %
25 \lccode`\{`\ %
26 \lccode`\T`\T%
27 \lccode`\H`\H%
28 \catcode`\ =11\relax%
29 \lowercase{%
30 \egroup%

```

Unfortunately TeX versions older than 3.141 have a bug which means that `^J` does not force a linebreak in `\message` and `\errmessage` commands. So for these old TeX's we use `\typeout` to produce the message, and then have an empty `\errmessage` command. This causes an extra line of the form

```
! .
```

To appear on the terminal, but if you do not like it, you can always upgrade your TeX! In order for your format to use this version, you must define the macro `\@TeXversion` to be the version number, e.g., 3.14 of the underlying TeX. See the comments in `ltdircheck.dtx`.

```

31 \dimen@\ifx\@TeXversion\undefined4\else\@TeXversion\fi\p@%
32 \ifdim\dimen@>3.14\p@%

```

First the 'standard case'.

```

33 \DeclareRobustCommand{\GenericError}[4]{%

87 ⟨/2ekernel | def⟩

```

\PackageError
\PackageWarning

\PackageWarningNoLine
\PackageInfo
\ClassError
\ClassWarning
\ClassWarningNoLine
\ClassInfo

These commands are intended for use by package and class writers, to give information to authors. The syntax is:

```

\PackageError{⟨package⟩}{⟨error⟩}{⟨help⟩}%
\PackageWarning{⟨package⟩}{⟨warning⟩}%
\PackageWarningNoLine{⟨package⟩}{⟨warning⟩}%
\PackageInfo{⟨package⟩}{⟨info⟩}

```

and similarly for classes. The **Error** commands print the *⟨error⟩* message, and present the interactive prompt; if the author types **h**, then the *⟨help⟩* information is displayed. The **Warning** commands produce a warning but do not present the interactive prompt. The **WarningNoLine** commands do the same, but don't print the input line number. The **Info** commands write the message to the **log** file. Within the messages, the command **\MessageBreak** can be used to break a line, **\protect** can be used to protect command names, and **\space** is a space, for example:

```

\newcommand{\foo}{FOO}
\PackageWarning{ethel}{%
  Your hovercraft is full of eels,\MessageBreak
  and \protect\foo\space is \foo}

```

produces:

```

Package ethel warning: Your hovercraft is full of eels,
(ethel) and \foo is FOO on input line 54.

```

```

```

`\@nodocument` Error produced if paragraphs are typeset in the preamble.

```
231 
```

```
(def)\gdef\@nodocument{%
232 (!def) \@latex@error{Missing \protect\begin{document}}}\@ehd}
```

`\@badend` Called by `\end` that doesn't match its `\begin`. RmS 1992/08/24: added code to `\@badend` to display position of non-matching `\begin`. FMi 1993/01/14: missing space added.

```
233 \gdef\@badend#1{%
```

```

234 ⟨!autoload⟩  \@latex@error{\protect\begin{⟨@currenvir⟩}\@currenvline
235 ⟨!autoload⟩                                \space ended by \protect\end{#1}\}@eha}
236 ⟨autoload⟩  \@autoerr\@badend}

\@badmath Called by \[, \], \( or \) when used in wrong mode.
237 \gdef\@badmath{%
238 ⟨!autoload⟩  \@latex@error{Bad math environment delimiter}\@eha}
239 ⟨autoload⟩  \@autoerr\@badmath}

\@toodeep Called by a list environment nested more than six levels deep, or an enumerate or
itemize nested more than four levels.
240 \gdef\@toodeep{%
241 ⟨!autoload⟩  \@latex@error{Too deeply nested}\@ehd}
242 ⟨autoload⟩  \@autoerr\@toodeep}

\@badpoptabs Called by \endtabbing when not enough \poptabs have occurred, or by \poptabs
when too many have occurred.
243 \gdef\@badpoptabs{%
244 ⟨!autoload⟩  \@latex@error{\protect\pushtabs\space and \protect\poptabs
245 ⟨!autoload⟩      \space don't match}\@ehd}
246 ⟨autoload⟩  \@autoerr\@badpoptabs}

\@badtab Called by \>, \+ , \- or \< when stepping to an undefined tab.
247 \gdef\@badtab{%
248 ⟨!autoload⟩  \@latex@error{Undefined tab position}\@ehd}
249 ⟨autoload⟩  \@autoerr\@badtab}

\@preamerr This error is special: it appears in places where we normally have to \protect
expansions. However, to prevent a protection of the error message itself (which
would result in the message getting printed not issued on the terminal) we need
to locally reset \protect to \relax.
250 \gdef\@preamerr#1{%
251   \begingroup
252     \let\protect\relax

ltpar.dtx

15 Paragraphs

This section of the kernel declares the commands used to set `\par` and `\everypar` when ever their function needs to be changed for a long time.

15.1 Implementation

There are two situations in which `\par` may be changed:

- Long-term changes, in which the new value is to remain in effect until the current environment is left. The environments that change `\par` in this way are the following:
 - All list environments (itemize, quote, etc.)
 - Environments that turn `\par` into a noop: tabbing, array and tabular.
- Temporary changes, in which `\par` is restored to its previous value the next time it is executed. The following are all such uses.
 - `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
 - The mechanism for avoiding page breaks and getting the spacing right after section heads.

`\@setpar` To permit the proper interaction of these two situations, long-term changes are made by the `\@setpar{\langle VAL\rangle}` command. It's function is:

To set `\par`. It `\def`'s `\par` and `\@par` to `\langle VAL\rangle`.

`\@restorepar` Short-term changes are made by the usual `\def\par` commands. The original values are restored after a short-term change by the `\@restorepar` commands.

`\@par` `\@par` always is defined to be the original TeX `\par`.

`\everypar` `\everypar` is changed only for the short term. Whenever `\everypar` is set non-null, it should restore itself to null when executed.

The following commands change `\everypar` in this way:

- `\item`
- `\end` when preceded by `\@endparenv`, which is called by `\endtrivlist`
- `\minipage`

When dealing with `\par` and `\everypar` remember the following two warnings:

1. Commands that make short-term changes to `\par` and `\everypar` must take account of the possibility that the new commands and the ones that do the restoration may be executed inside a group. In particular, `\everypar` is executed inside a group whenever a new paragraph begins with a left brace. The `\everypar` command that restores its definition should be local to the current group (in case the command is inside a minipage used inside someplace

where `\everypar` has been redefined). Thus, if `\everypar` is redefined to do an `\everypar{}` it could take several executions of `\everypar` before the restoration “holds”. This usually causes no problem. However, to prevent the extra executions from doing harm, use a global switch to keep anything harmful in the new `\everypar` from being done twice.

2. Commands that change `\everypar` should remember that `\everypar` might be supposed to set the following switches false:

- `@nobreak`
- `@minipage`

they should do the setting if necessary.

```
1 {*2ekernel}
2 \message{par,}
```

`\@setpar` Initiate a long-term change to `\par`.

`\@par` 3 `\def\@setpar#1{\def\par{\#1}\def\@par{\#1}}`

The default definition of `\@par` will ensure that if `\@restorepar` defines `\par` to execute `\@par` it will redefine itself to the primitive `\@@par` after one iteration.

```
4 \def\@par{\let\par\@@par\par}
5 /2ekernel}
```

`\@restorepar` Restore from a short-term change to `\par`.

```
6 \def\@restorepar{\def\par{\@par}}
```

ltspacex.dtx

16 Spacing

This section deals with spacing, and line- and page-breaking.

16.1 User Commands

```
\nopagebreak  [i] : i = 0,...,4.  
               Default argument = 4. Puts a penalty into the vertical list output as follows:  
0 : penalty = 0  
1 : penalty = \@lowpenalty  
2 : penalty = \@medpenalty  
3 : penalty = \@highpenalty  
4 : penalty = 10000  
\pagebreak  [i] : same as except negatives of its penalty  
\linebreak  [i] : analog of the above  
\nolinebreak [i] : analog of the above  
\samepage   : inhibits page breaking most places by setting the following penalties to 10000:  
  \interlinepenalty  
  \postdisplaypenalty  
  \interdisplaylinepenalty  
  \begin{parpenalty}  
  \end{parpenalty}  
  \itempenalty  
  \secpenalty  
  \interfootnotelinepenalty  
\\  : initially defined to be \newline  
    \\[length] : initially defined to be \vspace{\length}\\newline  
Note: \\* adds a \vadjust{\penalty 10000}  
      OBSOLETE COMMANDS (which never made it into the manual):  
      \obeycr : defines jCR; == \\relax  
      \restorecr : restores jCR; to its usual meaning.
```

16.2 Chris' comments

There are several aspects of the handling of space in horizontal mode that are inconsistent or do not work well in some cases. These are largely concerned with ignoring the effect of space tokens that would otherwise typeset an inter-word space.

Negating the effect of such space tokens is achieved by two mechanisms:

- `\unskip` is used to remove the glue just added by a space that has already had its effect; it is sometimes invoked after an `\ifdim` test on `\lastskip` (see below);
- `\ignorespaces` is used to ignore space-tokens yet to come.

The test done on `\lastskip` is sometimes for equality with zero and sometimes for being positive. Recall also that the test is only on the natural length of the glue and that no glue cannot be distinguished from glue whose natural length is zero: to summarise, a pretty awful test. It is not clear why these tests are not all the same; I think that they should all be for equality. One place where `\unskip` is often used is just before a `\par` (which itself internally does an `\unskip`) and one bit of code (in `\@item`) even has two `\unskips` before a `\par`. These uses may be fossil code but if they are necessary, maybe `\@killglue` would be even safer.

Such removal of glue by `\unskip` may sometimes have the wrong result, removing not the glue from a space-token but other explicit glue; this is sometimes not what is intended.

A common way to prevent such removal is to add an `\hskip\z@` after the glue that should not be removed. This protects that glue against one `\unskip` with no test but not against more than one. It does work for ‘tested `\unskips`’. This is used by `\hspace*` but not by `\hspace`; this is inconsistent as the star is supposed to prevent removal only at the beginning of a line, not at the end, or in a tabular, etc.

If this reason for removing glue were the only consideration then a tested-`\unskip` and protection by `\hskip\z@` would suffice but would need to be consistently implemented.

However, the class of invisibles, commands and environments tries to be even cleverer: one of these tries to leave only one inter-word space whenever there is one before it and one after it; and it does this quite well.

But problems can arise when there is not a space-token on both sides of it; in particular, when an invisible appears at the beginning or end of a piece of text the method still leaves one space token whereas usually in these cases it should leave none.

Also, the current rules do not work well when more than one such command appears consecutively, separated by space-tokens; it leaves glue between every other invisible.

There is also a question about what these commands should do when they occur next to spaces that do not come from space tokens but, for example, from `\hspace`. Should they still produce ‘just one space’? If so, which one? It is good to note that the manual is sufficiently cautious about invisibles that we are not obliged to make anything work.

Another interesting side-road to explore is whether the space-tokens either side of an `\hspace{...}` should be ignored.

One alternative to the current algorithm that is often suggested is that all glue around the invisible should be consolidated into a space after it (usually without stating how much glue should be put there). The command `\nolinebreak` is implemented this way (and `\linebreak` should also be). This does not work correctly for the following common case:

```
... some text
\index{some-word}
some-word and more text.
```

This is optimal coding since it is normal to index a word that gets split across a page-break on its starting page. This would, on the other hand, fix another common (and documented) failure of the current system: when the invisible is

the last thing in a paragraph the space before it is not removed and, worse, it is also hidden from the paragraph-ending mechanism so that an ‘empty’ line can be created at the end of the paragraph.

Another deficiency (I think) of the current system is that the following is treated as having the `\index` command between the paragraphs, which is probably not what the author intended (since there is no empty line after it).

```
\index{beginnings}
Beginnings of paragraphs ...
```

I know of no algorithm that will handle satisfactorily even all the most common cases; note that it could be that the best algorithm may be different for different invisibles since, for example, the common uses and expected behaviour of `\index`, `\marginpar`, `\linebreak`, `\pagebreak` and `\vspace` are somewhat different. [For example, is `\vspace` ever used in the middle of a paragraph?]

One method that can (and is) used to make invisible commands produce no space when used at the beginning of text is to put in some glue that is nearly enough the same as no glue or glue of zero length in all respects except for the precise test for not being exactly equal to zero; examples of such glue are `\hskip 1sp` and, possibly better but more complex, `\hskip -1sp \hskip 1sp`. However, this only works when it is known that user-supplied text is about to start.

Some similar concerns apply to the handling of space and penalties in vertical mode; there is an extra hurdle here as `\unskip` does not work on the main vertical list. The complexity of the tests done by `\addvspace` have never been explained.

The implementation of space hacks etc for vertical mode is another major area that needs further attention; my earlier experiments did not produce much improvement over the current unsatisfactory situation.

One particular problem is what happens when the following very natural coding is used (part of the problem here is that this looks like an hmode problem, but it is not):

```
... end of text.

\begin{enumerate}
  \item \label{item:xxx} Item text.
\end{enumerate}
```

16.3 Some immediate actions

- Fix bug in `\linebreak`.
- Fix bug in `**`.
- Reimplement `\`, etc, removing extra `\vadjusts` and getting better error trapping (this seems to involve a lot more tokens).
- Investigate whether `\`, etc need to be errors in vmode; I think that they could be noops (maybe with a warning).
- Make all(?) `\unskip`s include test for zero skip (rather than other tests or no test).

- Consider replacing `\hskip 1sp` by something better (here called an ‘infinitesimal’ skip).
- Look at all `\hskip\z@` (or similar) to see if they should be changed to an ‘infinitesimal’ skip.
- Resolve the inconsistency between `\hspace` and `\hspace*`.
- Remove unnecessary `\unskip`s.
- Investigate and rationalise the ‘newline’ code.
- Find better algorithms for all sorts of things or, easier(?), fix TeX itself.

16.4 The code

```

55 \def\@getpen#1{\ifcase #1 \z@ \or \@lowpenalty\or
56           \@medpenalty \or \@highpenalty
57           \else \OM \fi}

\if@nobreak Switch used to avoid page breaks caused by \label after a section heading, etc.
It should be GLOBALLY set true after the \nobreak and globally set false by
the next invocation of \everypar.
    Commands that reset \everypar should globally set it false if appropriate.
58 \def\@nobreakfalse{\global\let\if@nobreak\iffalse}
59 \def\@nobreaktrue {\global\let\if@nobreak\iftrue}
60 \@nobreakfalse

\@savsk Registers used to save the space factor and last skip.
\@savsf
61 \newdimen\@savsk
62 \newcount\@savsf

\@bsphack \@bsphack and \@esphack used by macros such as \index and \begin{@float}
... \end{@float} that want to be invisible — i.e., not leave any extra space when
used in the middle of text. Such a macro should begin with \@bsphack and end
with \@esphack. The macro in question should not create any text, nor change the
mode.
    Before giving the current definition we give an extended definition that is
currently not used (because it doesn't work as advertised:-)
    These are generalised hacks which attempt to do sensible things when ‘invisible
commands’ appear in vmode too.
    They need to cope with space in both hmode (plus spacefactor) and vmode,
and also cope with breaks etc. In vmode this means ensuring that any following
\addvspace, etc sees the correct glue in \lastskip.
    In fact, these improved versions should be used for other cases of ‘whatsits,
thingies etc’ which should be invisible. They are only for commands, not environments
(see notes on \@Esphack).
    BTW, anyone know why the standard hacks are surrounded by \ifmmode\else
rather than simply \ifhmode?
    And are there any cases where saving the spacefactor is essential? I have some
extensions where it is, but it does not appear to be so in the standard uses.

\def \@bsphack{%
  \relax \ifvmode
    \@savsk \lastskip
    \ifdim \lastskip=\z@
    \else
      \vskip -\lastskip
    \fi
  \else
    \ifhmode
      \@savsk \lastskip
      \@savsf \spacefactor
    \fi
  \fi
}

```

I think that, in vmode, it is the safest to put in a `\nobreak` immediately after such things since writes, inserts etc followed by glue give valid breakpoints and, in general, it is possible to create breaks but impossible to destroy them.

```
\def \@esphack{%
  \relax \ifvmode
    \nobreak
    \ifdim \@savsk=\z@
  \else
    \vskip\@savsk
  \fi
  \else
    \ifhmode
      \spacefactor \savesf
      \ifdim \savsk>\z@
        \ignorespaces
      \fi
      \fi
    \fi
}
}
```

For the moment we are going to ignore the vertical versions until they are correct.

```
63 \def\bsphack{%
64   \relax
65   \ifhmode
66     \savsk\lastskip
67     \savesf\spacefactor
68   \fi}
}
```

`\@esphack` Companion to `\bsphack`.

```
69 \def\@esphack{%
70   \relax
71   \ifhmode
72     \spacefactor\savesf
73     \ifdim\@savsk>\z@
74       \ignorespaces
75     \fi
76   \fi}
}
```

`\@Esphack` A variant of `\@esphack` that sets the `@ignore` switch to true (as `\@esphack` used to do previously). This is currently used only for floats and similar environments.

```
77 \def\@Esphack{%
78   \relax
79   \ifhmode
80     \spacefactor\savesf
81     \ifdim\@savsk>\z@
82       \@ignoretrue
83       \ignorespaces
84     \fi
85   \fi}
}
```

\@vbsphack Another variant which is useful for invisible things which should not live in vmode (this is how some people feel about marginals).

If it occurs in vmode then it enters hmode and ensures that \csavsk is nonzero so that the \ignorespaces is put in later. It is not used at present.

```
\def \@vbsphack{ %
  \relax \ifvmode
    \leavevmode
    \csavsk 1sp
    \csavsf \spacefactor
  \else
    \ifhmode
      \csavsk \lastskip
      \csavsf \spacefactor
    \fi
  \fi
}
```

16.5 Vertical spacing

L^AT_EX supports the plain T_EX commands \smallskip, \medskip and \bigskip. However, it redefines them using \vspace instead of \vskip.

Extra vertical space is added by the command \addvspace{\langle skip\rangle}, which adds a vertical skip of \langle skip\rangle to the document. The sequence

\addvspace{\langle s1\rangle} \addvspace{\langle s2\rangle} is equivalent to
\addvspace{\langle maximum of s1, s2\rangle}.

\addvspace should be used only in vertical mode, and gives an error if it's not. The \addvspace command does *not* add vertical space if @minipage is true. The minipage environment uses this to inhibit the addition of extra vertical space at the beginning.

Penalties are put into the vertical list with the \addpenalty{\langle penalty\rangle} command. It works properly when \addpenalty and \addvspace commands are mixed.

The @nobreak switch is set true used when in vertical mode and no page break should occur. (Right now, it is used only by the section heading commands to inhibit page breaking after a heading.)

```
\addvspace{SKIP} ==
BEGIN
  if vmode
    then if @minipage
      else if \lastskip =0
        then \vskip SKIP
      else if \lastskip < SKIP
        then \vskip -\lastskip
              \vskip SKIP
      else if SKIP < 0 and \lastskip >= 0
        then \vskip -\lastskip
              \vskip \lastskip + SKIP
    fi      fi      fi      fi
  else useful error message (CAR).
  fi
END
```

\@xaddvskip Internal macro for \vspace handling the case that space has previously been added.

```
86 \def\@xaddvskip{%
87   \ifdim\lastskip<\@tempskipb
88     \vskip-\lastskip
89     \vskip\@tempskipb
90   \else
91     \ifdim\@tempskipb<\z@
92       \ifdim\lastskip<\z@
93         \else
94           \advance\@tempskipb\lastskip
95           \vskip-\lastskip
96           \vskip \@tempskipb
97         \fi
98       \fi
99     \fi}
```

\addvspace Add vertical space taking into account space already added, as described above.

```
100 \def\addvspace#1{%
101   \ifvmode
102     \if@minipage\else
103       \ifdim \lastskip =\z@
104         \vskip #1\relax
105       \else
106         \@tempskipb#1\relax
107         \@xaddvskip
108       \fi
109     \fi
110   \else
111     \noitemerr
112   \fi}
```

\addpenalty

```
113 \def\addpenalty#1{%
114   \ifvmode
115     \if@minipage
116     \else
117       \if@nobreak
118       \else
119         \ifdim\lastskip=\z@
120           \penalty#1\relax
121         \else
122           \@tempskipb\lastskip
123           \vskip -\lastskip
124           \penalty#1%
125           \vskip\@tempskipb
126         \fi
127       \fi
128     \fi
129   \else
130     \noitemerr
131   \fi}
```

\vspace The new code for these commands depends on the following facts:

\@vspace

\@vspacer File i: *ltspacex.dtx* Date: 2004/02/15 Version v1.3a

- The value of prevdepth is changed only when a box or rule is created and added to a vertical list;
- The value of prevdepth is used only when a box is created and added to a vertical list;
- The value of prevdepth is always local to the building of one vertical list.

```

132 \DeclareRobustCommand\vspace{\@ifstar\@vspace\@vspace}
133 \def\@vspace #1{%
134   \ifvmode

16.6 Horizontal space (and breaks)

`\nobreakdashes` This idea is borrowed from the `amsmath` package but here we define a robust command.

This command is a low-level command designed for use only before hyphens or dashes (such as `-`, `--`, or `---`).

It could probably be better implemented: it may need its own private token register and temporary command.

Setting the hyphen in a box and then unboxing it means that the normal penalty will not be added after it—and if the penalty is not there a break will not be taken (unless an explicit penalty or glue follows, thus the final `\nobreak`).

Note that even if it is not followed by a `'`, it still leaves vmode and sets the spacefactor; so use it carefully!

```

168 \DeclareRobustCommand{\nobreakdashes}{%
169   \leavevmode
170   \toks@{}%
171   \def\reserved@a##1{\toks@{\expandafter{\the\toks@-}}%
172                           \futurelet\@let@token \reserved@b}%
173   \def\reserved@b    {\ifx\@let@token -%
174                         \expandafter\reserved@a
175   \else
176     \setbox\z@\hbox{\the\toks@\nobreak}%
177     \unhbox\z@
178     \spacefactor\sfcode`-
179   \fi}%
180   \futurelet\@let@token \reserved@b
181 }

```

`\nobreakspace` This is a robust command that produces a horizontal space at which, in paragraph-mode, a line-break is not possible. We then define an active `~` to expand to it since this is the documented behaviour of `~`. One reason for introducing this is that some 8-bit input encodings have a slot for such a space and we do not want to use active characters as the L^AT_EX internal commands.

The braces in the definition of `~` are needed to ensure that a following space is preserved when reading to/from internal files.

We need to keep `\@xobeysp` as it is widely used; so here it is let to the non-robust command `\nobreakspace`.

```

182 \DeclareRobustCommand{\nobreakspace}{%
183   \leavevmode\nobreak\ }
184 \catcode `~=13
185 \def~{\nobreakspace{}}
186 \expandafter\let\expandafter\@xobeysp\csname nobreakspace \endcsname

```

`\,` Used in paragraph mode produces a `\thinspace`. It has the ordinary definition in math mode. Useful for quotes inside quotes, as in ‘‘\,‘Foo’, he said.’’

```

187 \DeclareRobustCommand{\,}{%
188   \relax\ifmmode\mskip\thinmuskip\else\thinspace\fi
189 }

```

`\.` Placed before a `.'`, makes it a sentence-ending period. Does the right thing for other punctuation marks as well. Does this by setting spacefactor to 1000.

```

ltfiles.dtx

18 File Handling

The following user commands are defined in this part:

\document	(ie \begin{document})
	Reads in the .AUX files and \catcode's @ to 12.
\nofiles	Suppresses all file output by setting \@filesw false.
\includeonly	\{(NAME1, ... ,NAMEn)\}
	Causes only parts NAME1, ... ,NAMEn to be read by their \include commands.
	Works by setting partsw true and setting \@partlist to NAME1, ... ,NAMEn.
\include	\{(NAME)\}
	Does an \input NAME unless \@partsw is true and NAME is not in \@partlist.
	If \@filesw is true, then it directs .AUX output to NAME.AUX, including a checkpoint at the end.
\input	\{(NAME)\}
	The same as TeX's \input, except it allows optional braces around the file name.
	In L ^A T _E X 2 _{ε} , it also avoids the primitive 'missing file' error, if the file can not be found.
\IfFileExists	\{(NAME)\}\{\(then)\}\{\(else)\}
	If the file exists on the system, execute <i>then</i> otherwise execute <i>else</i> .
\InputIfFileExists	\{(NAME)\}\{\(then)\}\{\(else)\}
	If the file exists on the system, execute <i>then</i> and input <i>NAME</i> otherwise execute <i>else</i> .
	1 (*2ekernel autoload)
	2 \message{files,}
	VARIABLES, SWITCHES AND INTERNAL COMMANDS:
\@mainaux	: Output file number for main .AUX file.
\@partaux	: Output file number for current part's .AUX file.
\@auxout	: Either \@mainout or \@partout, depending on which .AUX file output goes to.
\@input{foo}	: If file foo exists, then \input's it, otherwise types a warning message.
@filesw	: Switch – set false if no .AUX, .TOC, .IDX etc files are to be written
@partsw	: Set true by a \includeonly command.
\@partlist	: Set to the argument of the \includeonly command.
\cp@FOO	: The checkpoint for \include'd file FOO.TEX, written by \@writeckpt at the end of file FOO.AUX

```

Dateline 1991/03/26: FMi added `\process@table` to support NFSS; This will also work with old lfonts if no other style defines `\process@table`. The following line forces the initialization of the math fonts.

```
34  \process@table
35  \let\glb@currsize\@empty %% Force math initialization.
36  \normalsize
37  \everypar{\%}
```

So that punctuation in headings is not disturbed by verbatim or other local changes to the space factor codes, save the document default here. This will be locally reset by the output routine. For special cases a class may want to define `\normalsfcodes` directly, in case that definition will be used. (This is an old bug, problem existed in L^AT_EX2.0x and plain T_EX.)

```
38  \ifx\normalsfcodes\@empty
39  \ifnum\sfcodes`\.=\@m
40    \let\normalsfcodes\frenchspacing
41  \else
42    \let\normalsfcodes\nonfrenchspacing
43  \fi
44 \fi
```

Way back in 1991 (08/26) FMi & RmS set the `\@noskipsec` switch to true in the preamble and to false here. This was done to trap lists and related text in the preamble but it does not catch everything; hence Change 1.1g was introduced.

```
45  \@noskipsecfalse
46  \let \@refundefined \relax
```

Just before disabling the preamble commands we execute the begin document hook which contains any code contributed by `\AtBeginDocument`. Also disable the gathering of the file list, if no `\listfiles` has been issued. `\AtBeginDocument` is redefined at this point so that and such commands that get into the hook do not chase their tail...

```
47  \let\AtBeginDocument\@firstofone
48  \@begindocumenthook
```

Most of the following assignments will be done globally in case the user adds something like `\begin{multicols}` to the document hook, i.e. starts are group in `\begin{document}`.

Since a value of exactly 0pt for `\topskip` causes `\twocolumn[]` to misbehave, we add this check, hoping that it will not cause any problems elsewhere.

```
49  \ifdim\topskip<1sp\global\topskip 1sp\relax\fi
50  \global\@maxdepth\maxdepth
51  \global\let\@begindocumenthook\@undefined
52  \ifx\@listfiles\@undefined
53    \global\let\@filelist\relax
54    \global\let\@addtofilelist\@gobble
55  \fi
```

At the very end we disable all preamble commands. This has to happen after the begin document hooks was executed so that this hook can still use such commands.

```
56  \gdef\do##1{\global\let ##1\@notprerr}%
57  \@preamblecmds
```

The next line saves tokens and also allows `\@nодокумент` to be used directly to trap preamble errors.

```
58 \global\let \@nодокумент \relax
```

The next line is a pure safety measure in case a do list is ever expanded at the wrong place. In addition it will save a few tokens to get rid of the above definition.

```
59 \global\let\do\noexpand
```

Use of `\AtBeginDocument` hook might mean that we are already in horizontal mode, so ignore the space after `\begin{document}`.

```
60 \ignorespaces
```

```
61 \@onlypreamble\document
```

`\normalsfcodes` The setting of `\@empty` is just a flag. This command may be defined in a class or package file. If it is still `\@empty` at `\begin{document}` it will be defined to be `\frenchspacing` or `\nonfrenchspacing`, depending on which of those appears to be in effect at that point.

```
62 \let\normalsfcodes\@empty
```

`\nofiles` Set `\@fileswfalse` which suppresses the places where L^AT_EX makes `\immediate` writes. The `\makeindex` and `\maketoc` are disabled. `\protected@write` is redefined not to write to the file specified, but rather to write a blank line to the log file. This ensures that a `\whatsit` node is still created, and so spacing is not affected by the `\nofiles` command; to ensure this more generally, the `\if@nobreak` test is needed.

```
63 \def\nofiles{%
64   \@fileswfalse
65   \typeout{No auxiliary output files.^^J}%
66   \long\def\protected@write##1##2##3{%
67     {\write\m@ne{}\if@nobreak\ifvmode\nobreak\fi\fi}%
68   \let\makeindex\relax
69   \let\maketoc\relax
70 }@\onlypreamble\nofiles
```

`\protected@write` This takes three arguments: an output stream, some initialization code, and some text to write. It then writes this, with appropriate handling of `\protect` and `\thepage`.

```
71 \long\def \protected@write#1#2#3{%
72   \begingroup
73   \let\thepage\relax
74   #2%
75   \let\protect\@unexpandable@protect

190       \ifx\filename@ext\relax#2\else\filename@ext\fi}%
191     \edef\reserved@a{%
192       \noexpand\InputIfFileExists
193       {\filename@area\filename@base.\filename@ext}}%
```

```

194      {}%
195      {\noexpand\@missingfileerror
196      {\filename@area\filename@base}{\filename@ext}}}}%
197      \reserved@a
198      \fi}
199 </2ekernel | autoerr>
200 {*}2ekernel | autoload>

```

- \@obsoletefile For compatibility with L^AT_EX 2.09 document styles, we distribute files called *article.sty*, *book.sty*, *report.sty*, *slides.sty* and *letter.sty*. These use the command \@obsoletefile, which produces a warning message.
- ```

201 \def\@obsoletefile#1#2{%
202 \@latex@warning@no@line{inputting '#1' instead of obsolete '#2'}}%
203 \onlypreamble\@obsoletefile

```

## 18.2 Listing files

- \@filelist A list of files input so far. The initial value of \gobble eats the comma before the first file name.
- ```

204 \let\@filelist\gobble

```

- \@addtofilelist Add to the list of files input so far. This ‘real’ definition is only used for ‘cfg’ files during initex. An initial definition of \gobble has already been set.
- ```

205 \% \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}

```

- \listfiles A preamble command to cause \end{document} to list files input from the main file.

```

206 \def\listfiles{%
207 \let\listfiles\relax
208 \def\@listfiles##1##2##3##4##5##6##7##8##9\@@{%
209 \def\reserved@d{\\"{}}%
210 \@tfor\reserved@c:=##1##2##3##4##5##6##7##8\do{%
211 \ifx\reserved@c\reserved@d
212 \edef\filename@area{\filename@area}%
213 \fi}%
214 \def\@dofilelist{%
215 \typeout{^^J *File List*}%
216 \for\@currname:=\@filelist\do{%
217 \filename@parse\@currname
218 \edef\reserved@a{%
219 \filename@base.%%
220 \ifx\filename@ext\relax tex\else\filename@ext\fi}%
221 \expandafter\let\expandafter\reserved@b
222 \csname ver@\reserved@a\endcsname
223 \expandafter\expandafter\expandafter\@listfiles\expandafter
224 \filename@area\filename@base\\\\\\\\\\\\\\\\\\\\\\\\\@c
225 \typeout{%
226 \filename@area\reserved@a
227 \ifx\reserved@b\relax\else\@spaces\reserved@b\fi}%
228 \typeout{ *****^J}}}

```

The `\@filelist` will be de-activated if `\listfiles` does not appear in the preamble. `\begin{document}` contains code equivalent to the following:

```
\AtBeginDocument{%
 \ifx\@listfiles\@undefined
 \let\@filelist\relax
 \let\@addtofilelist\@gobble
 \fi}
229 \@onlypreamble\listfiles

\@dofilelist
230 \let\@dofilelist\relax
231 </2ekernel | autoload>
```

# File 1

## ltoutenc.dtx

### 19 Font encodings

This section of the kernel contains commands for declaring encoding-specific commands, such as accents. It also contains the code for some of the encoding files, including `omlenc.def`, `omsenc.def`, `t1enc.def` and `ot1enc.def` files, which define the OLM, OMS, T1 and OT1 encodings, and the `fontenc` package for selecting encodings.

The `fontenc` package has options for encodings, of which the last option is the default encoding. For example, to use the OT2, OT3 and T1 encodings, with T1 as the default, you say:

```
\usepackage[OT2,OT3,T1]{fontenc}
```

The standard kernel set-up loads font encoding files and selects an encoding as follows.

```
\input{omlenc.def}
\input{t1enc.def}
\input{ot1enc.def}
\input{omsenc.def}
\fontencoding{OT1}
```

Note that the files in the standard `inputenc` package depend on this behaviour of the kernel.

The syntax for declaring encoding-specific commands is:

```
\DeclareTextCommand{\command}{{encoding}}
[number] [default] {commands}
```

This command is like `\newcommand`, except that it defines a command which is specific to one encoding. The resulting command is always robust, even if its definition is fragile. For example, the definition of `\l` in the OT1 encoding is:

```
\DeclareTextCommand{\l}{OT1}{{\@xxxii 1}}
```

`\DeclareTextCommand` takes the same optional arguments as `\newcommand`.

```
\ProvideTextCommand{\command}{{encoding}}
[number] [default] {commands}
```

This acts like `\DeclareTextCommand`, but does nothing if the command is already defined.

```
\DeclareTextSymbol{\command}{{encoding}}{\slot}
```

This command defines a text symbol, with a particular slot in that encoding. The commands:

```
\DeclareTextSymbol{\ss}{OT1}{25}
\DeclareTextCommand{\ss}{OT1}{\char25 }
```

have the same effect, but the `\DeclareTextSymbol` is faster.

```
\DeclareTextAccent{\command}{\encoding}{\slot}
```

This command declares a text accent. The commands:

```
\DeclareTextAccent{"}{OT1}{127}
\DeclareTextCommand{"}{OT1}{\add@accent {127}}
```

have the same effect.

```
\DeclareTextComposite{\command}
{\encoding}{\argument}{\slot}
```

This command declares a composite letter, for example in the T1 encoding `\'fa` is slot 225, which is declared by:

```
\DeclareTextComposite{\'}{T1}{a}{225}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

`\DeclareTextComposite` is the most common example of using the more general declaration `\DeclareTextCompositeCommand`, which can define a composite to be an arbitrary piece of text.

```
\DeclareTextCompositeCommand{\command}
{\encoding}{\argument}{\text}
```

For example, in the OT1 encoding Å has a hand-crafted definition this is declared as follows

```
\DeclareTextCompositeCommand{\r}{OT1}{A}
{\leavevmode\setbox\z@\hbox{!}\dimen@.ht\z@\advance\dimen@-1ex%
 \rlap{\raise.67\dimen@\hbox{\char23}}A}
```

The *command* will normally have been declared with `\DeclareTextAccent`, or as a one-argument `\DeclareTextCommand`.

The commands defined using the above declarations can be used in two ways. Normally they are used by just calling the command in the appropriate encoding, for example `\ss`. However, sometimes you may wish to use a command in an encoding where it is not defined. If the command has no arguments, then you can use it in another encoding by calling `\UseTextSymbol`:

```
\UseTextSymbol{\encoding}{\command}
```

v1.9e1997/08/05 Corrected order of arguments in `\UseTextSymbol` example.  
For example, `\UseTextSymbol{OT1}{\ss}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\ss}
```

If the command has one argument then you can use it in another encoding by calling `\UseTextAccent`:

```
\UseTextAccent{\encoding}{\command}{\text}
```

For example, if the current encoding is OT2 then `\UseTextAccent{OT1}{\'fa}` has the same effect as:

```
{\fontencoding{OT1}\selectfont\'{\fontencoding{OT2}\selectfont a}}
```

You can also declare a default definition for a text command, which will be used if the current encoding has no appropriate definition. Such use will also set the definition for this command in the current encoding to equal this default definition; this makes subsequent uses of the command much faster.

```
\DeclareTextCommandDefault{\command}{\definition}
```

For example, the default definition of the command `\textonequarter` (which produces the fraction  $\frac{1}{4}$ ) could be built using math mode:

```
\DeclareTextCommandDefault{\textonequarter}{\ensuremath {\frac{1}{4}}}
```

There is a matching `\Provide` command which will not override an existing default definition:

```
\ProvideTextCommandDefault{\command}{\definition}
```

The most common use for these commands is to use symbols from other encodings, so there are some optimizations provided:

```
\DeclareTextSymbolDefault{\command}{\encoding}
\DeclareTextAccentDefault{\command}{\encoding}
```

are short for:

```
\DeclareTextCommandDefault{\command}
 {\UseTextSymbol{\encoding}{\command}}
\DeclareTextCommandDefault[1]{\command}
 {\UseTextAccent{\encoding}{\command}{\#1}}
```

For example, to make OT1 the default encoding for `\ss` and `\'` you say:

```
\DeclareTextSymbolDefault{\ss}{OT1}
\DeclareTextAccentDefault{\'}{OT1}
```

Note that you can use these commands on any zero- or one-argument commands declared with `\DeclareText*` or `\ProvideText*`, not just those defined using `\DeclareTextSymbol` or `\DeclareTextAccent`.

## 19.1 Removing encoding-specific commands

In some cases encoding definitions are given to provide some limited support since nothing better is available, for example, the definition for `\textdollar` in OT1 is a hack since `$` and `£` actually share the same slot in this encoding. Thus if such a glyph becomes available in a different encoding (e.g., TS1) one would like to get rid of the flaky one and make the default definition point to the new encoding. In such a case defining

```
\DeclareTextSymbol{\textdollar}{TS1}{36}
\DeclareTextSymbolDefault{\textdollar}{TS1}
```

is not enough since if typesetting in OT1 L<sup>A</sup>T<sub>E</sub>X will still find the encoding specific definition for OT1 and therefore ignore the new default. Therefore to ensure that in this case the TS1 version is used we have to remove the OT1 declaration:

```
\UndeclareTextCommand{\textdollar}{OT1}
```

Since the \$ sign is a proper glyph in the T1 encoding there is no point removing its definition and forcing L<sup>A</sup>T<sub>E</sub>X to pick up the TS1 version if typesetting in this encoding. However, assume you want to use the variant dollar sign, i.e., \$ for your dollars. In that case you have to get rid of the T1 declaration as well, e.g., the following would do that for you:

```
\UndeclareTextCommand{\textdollar}{OT1}
\UndeclareTextCommand{\textdollar} {T1}
\DeclareTextCommandDefault{\textdollar}
 {\UseTextSymbol{TS1}\textdollaroldstyle}
```

## 19.2 The order of declarations

If an encoding-specific command is defined for more than one encoding, then it will execute fastest in the encoding in which it was defined last since its top-level definition will be set up to execute in that encoding without any overhead.

For this reason the file `fonttext.ltx` currently first loads the definitions for the T1 encoding and then those for the OT1 encoding so that typesetting in OT1 is optimized since that is (still) the default. However, when T1 is explicitly requested (via `\usepackage[T1]{fontenc}`) the top-level definitions are automatically changed to favour T1 since its declarations are reloaded in the process.

For the same reason default declarations should never come last since they are implemented as a special encoding themselves (with the name ?). Specifying them last would simply mean to make those encoding-specific commands equally inefficient in all encodings. Therefore the `textcomp` package, for example, first sets up all defaults to point to TS1 and then declares the commands in the TS1 encoding.

## 19.3 Docstrip modules

This .dtx file is be used to generate several related files containing font encoding definitions. The mutually exclusive docstrip options are listed here.

|          |                                                                                                                                                                                                 |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T1       | generates <code>t1enc.def</code> for the Cork encoding.                                                                                                                                         |
| TS1      | generates <code>ts1enc.def</code> for the Text Companion encoding.                                                                                                                              |
| TS1sty   | generates <code>textcomp.sty</code> , package that sets up use of the Text Companion encoding.                                                                                                  |
| OT1      | generates <code>ot1enc.def</code> for Knuth's CM encoding.                                                                                                                                      |
| OMS      | generates <code>omsenc.def</code> for Knuth's math symbol encoding.                                                                                                                             |
| OML      | generates <code>omlenc.def</code> for Knuth's math letters encoding.                                                                                                                            |
| OT4      | generates <code>ot4enc.def</code> for the Polish extension to the OT1 encoding, created by B. Jackowski and M. Ry  ko for use with the Polish version of Computer Modern and Computer Concrete. |
| package  | generates <code>fontenc.sty</code> for selecting encodings.                                                                                                                                     |
| 2ekernel | for the kernel commands.                                                                                                                                                                        |
| autoload | for the 'autoload' kernel commands.                                                                                                                                                             |
| autoerr  | for the autoerr.sty error message autoload file.                                                                                                                                                |

## 19.4 Definitions for the kernel

### 19.4.1 Declaration commands

This section contains definitions for commands such as accents which depend on the current encoding. These commands will usually be kept in .def files, for example `ot1enc.def` contains the definitions for the OT1 encoding.

```
1 <*2ekernel | autoload>
2 \message{font encodings,}
```

Far too many macros in one block here!

If you say:

```
\DeclareTextCommand{\foo}{T1}...
\ProvideTextCommand{\foo}{T1}...
\DeclareTextSymbol{@dec@text@cmd}{\chardef@text@cmd}{\changed@cmd}{\changed@x}
\TextSymbolUnavailable{\inmathwarn}
```

then `\foo` is defined to be `\T1-cmd \foo \T1\foo`, where `\T1\foo` is *one* control sequence, not two! We then call `\newcommand` to define `\T1\foo`.

```
3 \def\DeclareTextCommand{%
4 \@dec@text@cmd\newcommand}
5 \def\ProvideTextCommand{%
6 \@dec@text@cmd\providecommand}
7 \def\@dec@text@cmd#1#2#3{%
8 \expandafter\def\expandafter#2%
9 \expandafter{%
10 \csname#3-cmd\expandafter\endcsname
11 \expandafter#2%
12 \csname#3\string#2\endcsname
13 }%
14 \let\@ifdefinable\rc@ifdefinable
15 \expandafter#1\csname#3\string#2\endcsname}
```

This command was introduced to fix a major bug in `\@dec@text@cmd` without changing that command itself. This was thought to be necessary because it is defined in more than one package. (Perhaps the more serious bug is to put complex low-level commands like this in packages?)

The problem it solves is that whereas both `\newcommand` and `\providecommand` (used just above) both handle the resetting of `\@ifdefinable` (following its disabling in `\@dec@text@cmd`), the primitive `\chardef` neither needs the disabling, nor does the resetting.

```
16 \def\chardef@text@cmd{%
17 \let\@ifdefinable\@ifdefinable
18 \chardef
19 }
20 \def\DeclareTextSymbol#1#2#3{%
21 \@dec@text@cmd\chardef@text@cmd#1{#2}#3\relax
22 }
```

The declarations are only available before `\begin{document}`.

```
23 \onlypreamble\DeclareTextCommand
24 \onlypreamble\DeclareTextSymbol
```

The sneaky bit in all this is what `\T1-cmd \foo \T1\foo` does. There are five possibilities, depending on the current values of `\protect`, `\cf@encoding` and `\ifmmode`:

- If `\protect` is `\@typeset@protect` and `\cf@encoding` is `T1`, then we execute `\T1\foo`. This should be the normal behaviour, and is optimized for speed.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, and `\OT1\foo` is defined, then we execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, we're in text mode, and `\OT1\foo` is undefined, then we define `\OT1\foo` to be the default value of `\foo`, and execute `\OT1\foo`.
- If `\protect` is `\@typeset@protect`, `\cf@encoding` is (say) `OT1`, we're in math mode, and `\OT1\foo` is undefined, then we execute the default value of `\foo`. (This is necessary so that things like `$X_\copyright$` work properly.)
- If `\protect` is not `\@typeset@protect` then we execute `\noexpand\foo`. For example, if we are writing to a file, then this results in `\foo` being written. If we are in a `\mark`, then `\foo` will be put in the mark—since `\foo` is robust, it will then survive all the things which may happen to it whilst it's a `\mark`.

So after all that, we will either execute the appropriate definition of `\foo` for the current encoding, or we will execute `\noexpand\foo`.

The default value of `\foo` is `\?\foo` if it is defined, and an error message otherwise.

When the encoding is changed from `T1` to `OT1`, `\T1-cmd` is defined to be `\@changed@cmd` and `\OT1-cmd` is defined to be `\@current@cmd`. This means that the test for what the current encoding is can be performed quickly.

```

25 \def\@current@cmd#1{%
26 \ifx\protect\@typeset@protect
27 \inmathwarn#1%
28 \else
29 \noexpand#1\expandafter\gobble
30 \fi}

31 \def\@changed@cmd#1#2{%
32 \ifx\protect\@typeset@protect
33 \inmathwarn#1%
34 \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
35 \expandafter\ifx\csname ?\string#1\endcsname\relax
36 \expandafter\def\csname ?\string#1\endcsname{%
37 \TextSymbolUnavailable#1%
38 }%
39 \fi
40 \global\expandafter\let
41 \csname\cf@encoding\string#1\expandafter\endcsname
42 \csname ?\string#1\endcsname
43 \fi
44 \csname\cf@encoding\string#1%
45 \expandafter\endcsname
46 \else
47 \noexpand#1%
48 \fi}

49 </2ekernel | autoload>

```

```

50 <*2ekernel | autoerr>
51 \gdef\TextSymbolUnavailable#1{%
52 \@latex@error{%
53 Command \protect#1 unavailable in encoding \cf@encoding\%
54 }\@eha}
55 </2ekernel | autoerr>
56 {autoload}\gdef\TextSymbolUnavailable{@autoerr\TextSymbolUnavailable}
57 {*2ekernel | autoload}

```

The command `\@inmathwarn` produces a warning message if we are currently in math mode. Note that since this command is used inside text commands, it can't call `\relax` before the `\ifmmode`. This means that it is possible for the warning to fail to be issued at the beginning of a row of an `halign` whose template enters math mode. This is probably a bad feature, but there's not much that can be done about it, since adding a `\relax` would break ligatures and kerning between text symbols.

A more efficient solution would be to make `\@inmathwarn` and `\@inmatherr` equal to `\@empty` and `\relax` by default, and to have `\everymath` reset them to their usual definitions. This is left for future investigation (for example it may break some third party code).

```

58 \def\@inmathwarn#1{%
59 \ifmmode
60 \@latex@warning{Command \protect#1 invalid in math mode}%
61 \fi}

```

`\DeclareTextCommandDefault` These define commands with encoding ?.

`\ProvideTextCommandDefault` Note that `\DeclareTextCommandDefault` can only be used in the preamble, but that the `\Provide` version is allowed in inputenc .def files, so is allowed anywhere.

```

62 \def\DeclareTextCommandDefault#1{%
63 \DeclareTextCommand#1?}
64 \def\ProvideTextCommandDefault#1{%
65 \ProvideTextCommand#1?}
66 \@onlypreamble\DeclareTextCommandDefault
67 %\@onlypreamble\ProvideTextCommandDefault

```

They require `\?-cmd` to be initialized as `\@changed@cmd`.

```
68 \expandafter\let\csname?-cmd\endcsname\@changed@cmd
```

`\DeclareTextAccent` This is just a disguise for defining a `\text{TEX}` `\text{accent}` command.

```

69 \def\DeclareTextAccent#1#2#3{%
70 \DeclareTextCommand#1{#2}{\add@accent{#3}}}
71 \@onlypreamble\DeclareTextAccent

```

`\add@accent` To save space this code is shared between all text accents that are set using the `\text{accent}` primitive. The argument is pre-set in a box so that any font loading that is needed is already done within the box. This is needed because font-loading involves grouping and that would prevent the accent mechanism from working so that the accent would not be positioned over the argument. Declarations that change the font should be allowed (only low-level ones are at present) inside the

argument of an accent command, but not size changes, as they involve `\setbox` operations which also inhibit the mechanism of the `\accent` primitive.

Note that the whole process is within a group. For a detailed discussion of this reimplementation and its deficiencies, see pr/3160. v1.9z2000/01/30Macro reimplemented (pr/3160)

```
72 \def\add@accent#1#2{\hmode@bgroup
```

Turn off the group in `\UseTextSymbol` in case this is used inside the argument of `\add@accent`.

```
73 \let\hmode@start@before@group@\firstofone
74 \setbox\@tempboxa\hbox{#2%
```

When presetting the argument in a box we record its `\spacefactor` for later use after the accent got typeset. This way something like `\`A` gets the spacefactor of A (i.e., 999) rather than the default value of 1000.

```
75 \global\mathchardef\accent@spacefactor\spacefactor}%
76 \accent#1 #2\egroup\spacefactor\accent@spacefactor}
```

Default definition for `\accent@spacefactor` prevents a horrible death of the above macro inside an unprotected `\edef`.

```
77 \let\accent@spacefactor\relax
```

```
\hmode@bgroup
```

```
78 \def\hmode@bgroup{\leavevmode\bgroup}
```

`\DeclareTextCompositeCommand`  
`\DeclareTextComposite`  
 `@text@composite`  
 `@text@composite@x`  
 `@strip@args`

Another amusing game to play with `\expandafter`, `\csname`, and `\string`. When you say `\DeclareTextCompositeCommand{\foo}{T1}{a}{bar}`, we look to see if the expansion of `\T1\foo` begins with `@text@composite`, and if it doesn't, we redefine `\T1\foo` to be:

```
#1 -> @text@composite \T1\foo #1\empty @text@composite {...}
```

where ... is the previous definition of `\T1\foo`. Finally, we define `\T1\foo-a` to expand to `bar`.

```
79 \def\DeclareTextCompositeCommand#1#2#3#4{%
80 \expandafter\let\expandafter\reserved@a\csname#2\string#1\endcsname
81 \expandafter\expandafter\expandafter\ifx
82 \expandafter\@car\reserved@a\relax\relax@nil @text@composite \else

88 ####1\noexpand\empty\noexpand@text@composite
89 {##1}}%
90 \expandafter\reserved@b\expandafter{\reserved@a{##1}}%
91 \fi
92 \expandafter\def\csname\expandafter\string\csname
93 #2\endcsname\string#1-\string#3\endcsname{#4}}}

94 \onlypreamble\DeclareTextCompositeCommand
```

This all works because:

```
\text@composite \T1\foo A\empty @text@composite {...}
```

expands to `\T1\foo-A` if `\T1\foo-A` has been defined, and `{...}` otherwise.

Note that `\@text@composite` grabs the first token of the argument and puts just that in the csname. This is so that `\'{\textit{e}}` will work—it checks whether `\T1`-\textit{e}` is defined (which presumably it isn't) and so expands to `{\accent 1 \textit{e}}`.

This trick won't always work, for example `\'{\itshape e}` will expand to (with spaces added for clarity):

```
\csname \string \T1` - \string {\itshape e} \empty \endcsname
```

which will die pretty horribly. Unfortunately there's not much can be done about this if we're going to use `\csname` lookups as a fast way of accessing composites.

This has an unfortunate ‘misfeature’ though, which is that in the T1 encoding, `\'{aa}` produces á. This is not the expected behaviour, and should perhaps be fixed if the fix doesn't affect performance too badly.

Finally, it's worth noting that the `\empty` is used in `\@text@composite` so that accents will work even when the argument is empty. If you say `\'{}{}` then this looks up `\T1`-\empty`, which ought to be `\relax`, and so all is well. If we didn't include the `\empty`, then `\'{}{}` would expand to:

```
\csname \string \T1` - \string \endcsname
```

so the `\endcsname` would be `\string`ed` and the whole of the rest of the document would be put inside the `\csname`. This would not be good.

```
95 \def\@text@composite#1#2#3\@text@composite{%
96 \expandafter\@text@composite@x
97 \csname\string#1\string#2\endcsname}
```

Originally the `\@text@composite@x` macro had two arguments and if #1 was not `\relax` it was executed, otherwise #2 was executed. All this happened within the `\ifx` code so that neither #1 nor #2 could have picked up any additional arguments from the input stream. This has now being changed using the typical `\@firstoftwo / \@secondoftwo` coding. This way the final expansion will happen without any `\else` or `\fi` intervening in the case that we need to get a further token from the input stream.

```
98 \def\@text@composite@x#1{%
99 \ifx#1\relax
100 \expandafter\@secondoftwo
101 \else
102 \expandafter\@firstoftwo
103 \fi
104 #1}
```

The command `\DeclareTextComposite` uses `\DeclareTextCompositeCommand` to declare a command which expands out to a single glyph.

```
105 \catcode\z@=11\relax
106 \def\DeclareTextComposite#1#2#3#4{%
107 \def\reserved@a{\DeclareTextCompositeCommand#1{#2}{#3}{#4}}%
108 \bgroup
109 \lccode\z@#4%
110 \lowercase{%
111 \egroup
112 \reserved@a ^~@}}
```

```

113 \catcode\z@=15\relax
114 \onlypreamble\DeclareTextComposite
\UseTextAccent These fragile commands access glyphs from different encodings. They use grotty
\UseTextSymbol low-level calls to the font selection scheme for speed, and in order to make sure
\@use@text@encoding that \UseTextSymbol doesn't do anything which you're not allowed to do between
 an \accent and its glyph.

 For a detailed discussion of this reimplementation and its deficiencies, see
pr/3160. v1.9z2000/01/30Macro reimplemented (pr/3160)

115 \def\UseTextAccent#1#2#3{%
116 \hmode@start@before@group
117 {%

121 #2{\@use@text@encoding\curr@enc#3}%
122 }%
123 \def\UseTextSymbol#1#2{%
124 \hmode@start@before@group
125 {%
126 \def\@wrong@font@char{\MessageBreak
127 for \noexpand\symbol{'\string#2'}\%
128 \@use@text@encoding{#1}%
129 #2%
130 }%
131 }%
132 \def\@use@text@encoding#1{%
133 \edef\f@encoding{#1}%
134 \xdef\font@name{%
135 \csname\curr@fontshape/\f@size\endcsname}%
136 \pickup@font
137 \font@name
138 \@@enc@update}%
\hmode@start@before@group The \hmode@start@before@group starts hmode and should be immediately fol-
 lowed by an explicit {...}. Its purpose is to ensure that hmode is started before
 this group is opened. Inside \add@accent and \UseTextAccent it is redefined to
 remove this group so that it doesn't conflict with the \accent primitive.

 For a detailed discussion see pr/3160.

139 \let\hmode@start@before@group\leavevmode

\DeclareTextSymbolDefault Some syntactic sugar. Again, these should probably be optimized for speed.
\DeclareTextAccentDefault 140 \def\DeclareTextSymbolDefault#1#2{%
141 \DeclareTextCommandDefault#1{\UseTextSymbol{#2}{#1}}%
142 \def\DeclareTextAccentDefault#1#2{%
143 \DeclareTextCommandDefault#1{\UseTextAccent{#2}{#1}}%
144 \onlypreamble\DeclareTextSymbolDefault
145 \onlypreamble\DeclareTextAccentDefault

```

\UndeclareTextCommand This command safely removes and encoding specific declaration for a given encoding. It is helpful if one intends to use the default definition always and therefore wants to get rid of a declaration for some specific encoding.

```
146 \def\UndeclareTextCommand#1#2{%
```

If there is no declaration for the current encoding do nothing. (This makes a hash table entry but without e<sub>T</sub>E<sub>X</sub> we can't do anything about that).

```
147 \expandafter\ifx\csname#2\string#1\endcsname\relax
148 \else
```

Else: throw away that declaration.

```
149 \global\expandafter\let\csname#2\string#1\endcsname
150 \undefined
```

But this is unfortunately not enough, we have to take a look at the top-level definition of the encoding specific command which for a command \foo would look similar to \T1-cmd \foo \T1\foo (three tokens).

Of course, instead of T1 one could see a different encoding name; which one depends the encoding for which \foo was declared last.

Now assume we have just removed the declaration for \foo in T1 and the top-level of \foo expands to the above. Then we better change that pretty fast otherwise we do get an “undefined csname error” when we try to typeset \foo within T1 instead of getting the default definition for \foo. And what is the best way to change that top-level definition? Well, the only “encoding” we know for sure will still be around is the default encoding denoted by ?.

Thus in case the last token of the top-level expansion is now undefined we change the declaration to look like \?-cmd \foo \?\foo which is done by the following (readable?) code:

```
151 \expandafter\expandafter\expandafter
152 \ifx\expandafter@thirddofthree#1\undefined
153 \expandafter\gdef\expandafter#1\expandafter
154 {\csname ?-cmd\expandafter\endcsname\expandafter
155 #1\csname?\string#1\endcsname}%
156 \fi
157 \fi
158 }

159 \onlypreamble\UndeclareTextCommand
```

#### 19.4.2 Hyphenation

\patterns We redefine \patterns and \hyphenation to allow the use of commands declared with \DeclareText\* to be used inside them.

```
\@@patterns
160 %\let\@@patterns\patterns
\hyphenation 161 %\let\@@hyphenation\hyphenation
\@@hyphenation 162 %\def\patterns{%
163 % \bgroup
164 % \let\protect\empty

174 % \let\@changed@x\@changed@x@mouth
175 % \afterassignment\egroup
176 % \@@hyphenation
177 %}

```

#### 19.4.3 Miscellania

- \a The \a command is used to access the accent commands even when they have been redefined (for example by the tabbing environment). Its internal name is \@tabacckludge.

The \string within the \csname guards against something like ' being active at the point of use.

```

178 \def\@tabacckludge#1{\expandafter\@changed@cmd
179 \csname\string#1\endcsname\relax}
180 \let\@tabacckludge

```

#### 19.4.4 Default encodings

We define the default encodings for most commands to be either OT1, OML or OMS. These defaults are in the kernel and therefore fonts with these encodings must be available unless these defaults are redefined elsewhere. Recall that the standard kernel loads the encoding files for these encodings, and also that for the T1 encoding.

The naming conventions in the kernel are not what we would use if we were starting from scratch... Those defined by DEK (like \ae and \ss) or by the T<sub>E</sub>X Users Group Technical Working Group on multi-lingual typesetting (like \th and \ng) have short names. Those which were added to the kernel in 1993 and early 1994 are named after their Adobe glyph names (like \guillemotleft and \quotedblbase). Unfortunately, this naming scheme won't work for all glyphs, since some names (like \space) are already used, and some (like \endash) are very likely to be defined by users. So we're now using the naming scheme of \text followed by the Adobe name, (like \textendash and \textsterling). Except that some glyphs don't have Adobe names, so we're using the names used by fontinst for those (like \textcompwordmark). Sigh.

Some accents from OT1:

```

181 \DeclareTextAccentDefault{"}{OT1}
182 \DeclareTextAccentDefault{'}{OT1}
183 \DeclareTextAccentDefault{.}{OT1}
184 \DeclareTextAccentDefault{=}{OT1}
185 \DeclareTextAccentDefault{H}{OT1}
186 \DeclareTextAccentDefault{^}{OT1}
187 \DeclareTextAccentDefault{'}{OT1}
188 \DeclareTextAccentDefault{b}{OT1}
189 \DeclareTextAccentDefault{c}{OT1}
190 \DeclareTextAccentDefault{d}{OT1}
191 \DeclareTextAccentDefault{r}{OT1}
192 \DeclareTextAccentDefault{u}{OT1}
193 \DeclareTextAccentDefault{v}{OT1}

```

```

194 \DeclareTextAccentDefault{\`}{OT1}
Some symbols from OT1:
195 %\DeclareTextSymbolDefault{\AA}{OT1}
196 \DeclareTextSymbolDefault{\AE}{OT1}
197 \DeclareTextSymbolDefault{\L}{OT1}
198 \DeclareTextSymbolDefault{\OE}{OT1}
199 \DeclareTextSymbolDefault{\O}{OT1}
200 %\DeclareTextSymbolDefault{\aa}{OT1}
201 \DeclareTextSymbolDefault{\ae}{OT1}
202 \DeclareTextSymbolDefault{\i}{OT1}
203 \DeclareTextSymbolDefault{\j}{OT1}
204 \DeclareTextSymbolDefault{\l}{OT1}
205 \DeclareTextSymbolDefault{\oe}{OT1}
206 \DeclareTextSymbolDefault{\o}{OT1}
207 \DeclareTextSymbolDefault{\ss}{OT1}
208 \DeclareTextSymbolDefault{\textdollar}{OT1}
209 \DeclareTextSymbolDefault{\textemdash}{OT1}
210 \DeclareTextSymbolDefault{\textendash}{OT1}
211 \DeclareTextSymbolDefault{\textexcldown}{OT1}
212 %\DeclareTextSymbolDefault{\texthyphenchar}{OT1}
213 %\DeclareTextSymbolDefault{\texthyphen}{OT1}
214 \DeclareTextSymbolDefault{\textquestiondown}{OT1}
215 \DeclareTextSymbolDefault{\textquotedblleft}{OT1}
216 \DeclareTextSymbolDefault{\textquotedblright}{OT1}
217 \DeclareTextSymbolDefault{\textquotel}{OT1}
218 \DeclareTextSymbolDefault{\textquoter}{OT1}
219 \DeclareTextSymbolDefault{\textsterling}{OT1}

```

Some symbols from OMS:

```

220 \DeclareTextSymbolDefault{\textasteriskcentered}{OMS}
221 \DeclareTextSymbolDefault{\textbackslash}{OMS}
222 \DeclareTextSymbolDefault{\textbar}{OMS}
223 \DeclareTextSymbolDefault{\textbardbl}{OMS}
224 \DeclareTextSymbolDefault{\textbraceleft}{OMS}
225 \DeclareTextSymbolDefault{\textbraceright}{OMS}
226 \DeclareTextSymbolDefault{\textbullet}{OMS}
227 \DeclareTextSymbolDefault{\textdaggerdbl}{OMS}
228 \DeclareTextSymbolDefault{\textdagger}{OMS}
229 \DeclareTextSymbolDefault{\textparagraph}{OMS}
230 \DeclareTextSymbolDefault{\textperiodcentered}{OMS}
231 \DeclareTextSymbolDefault{\textsection}{OMS}
232 \DeclareTextAccentDefault{\textcircled}{OMS}

```

Some symbols from OML:

```

233 \DeclareTextSymbolDefault{\textless}{OML}
234 \DeclareTextSymbolDefault{\textgreater}{OML}
235 \DeclareTextAccentDefault{\t}{OML}

```

Some defaults we can fake.

The interface for defining \copyright changed, it used to use \expandafter to add braces at the appropriate points.

```

236 \DeclareTextCommandDefault{\textcopyright}{\textcircled{c}}
237 % \expandafter\def\expandafter
238 % \copyright\expandafter{\expandafter{\copyright}}

```

```

239 \DeclareTextCommandDefault{\textasciicircum}{\^{}}
240 \DeclareTextCommandDefault{\textasciitilde}{\~{}}
241 \DeclareTextCommandDefault{\textcompwordmark}{\leavevmode\kern\z@}
242 \DeclareTextCommandDefault{\textunderscore}{%
243 \leavevmode \kern.06em\vbox{\hrule\@width.3em}}
244 \DeclareTextCommandDefault{\textvisiblespace}{%
245 \mbox{\kern.06em\vrule \height.3ex}%
246 \vbox{\hrule \width.3em}%
247 \hbox{\vrule \height.3ex}}

```

Using \fontdimen3 in the next definition is some sort of a kludge (since it is the interword stretch) but it makes the ellipsis come out right in mono-spaced fonts too (since there it is zero).

```

248 \DeclareTextCommandDefault{\textellipsis}{%
249 .\kern\fontdimen3\font
250 .\kern\fontdimen3\font
251 .\kern\fontdimen3\font}
252 %\DeclareTextCommandDefault{\textregistered}{\textcircled{\scshape r}}
253 \DeclareTextCommandDefault{\textregistered}{\textcircled{%
254 \check@mathfonts\fontsize\sf@size\z@\math@fontsfalse\selectfont R}}
255 \DeclareTextCommandDefault{\texttrademark}{TM}
256 \DeclareTextCommandDefault{\SS}{\SS}

```

```

257 \DeclareTextCommandDefault{\textordfeminine}{a}
258 \DeclareTextCommandDefault{\textordmasculine}{o}

```

#### 19.4.5 Math material

Some commands can be used in both text and math mode:

```

259 \DeclareRobustCommand{\$}{\ifmmode\mathdollar\else\textdollar\fi}
260 \DeclareRobustCommand{\{}{\ifmmode\lbrace\else\textbraceleft\fi}
261 \DeclareRobustCommand{\}}{\ifmmode\rbrace\else\textbraceright\fi}
262 \DeclareRobustCommand{\P}{\ifmmode\mathparagraph\else\textparagraph\fi}
263 \DeclareRobustCommand{\$}{\ifmmode\mathsection\else\textsection\fi}
264 \DeclareRobustCommand{\dag}{\ifmmode{\dagger}\else\textdagger\fi}
265 \DeclareRobustCommand{\ddag}{\ifmmode{\ddagger}\else\textdaggerdbl\fi}

```

For historical reasons \copyright needs {} around the definition in maths.

```

266 \DeclareRobustCommand{_}{%
267 \ifmmode\nfss@text{\textunderscore}\else\textunderscore\fi}
268 \DeclareRobustCommand{\copyright}{%
269 \ifmmode{\nfss@text{\textcopyright}}\else\textcopyright\fi}
270 \DeclareRobustCommand{\pounds}{%
271 \ifmmode\mathsterling\else\textsterling\fi}
272 \DeclareRobustCommand{\dots}{%
273 \ifmmode\mathellipsis\else\textellipsis\fi}
274 \let\ldots\dots
275 </2ekernel | autoload>

```

## 19.5 Definitions for the OT1 encoding

The definitions for the ‘TeX text’ (OT1) encoding.

Declare the encoding.

```
276 {*OT1}
277 \DeclareFontEncoding{OT1}{}{}
```

Declare the accents.

```
278 \DeclareTextAccent{"}{OT1}{127}
279 \DeclareTextAccent{'}{OT1}{19}
280 \DeclareTextAccent{.}{OT1}{95}
281 \DeclareTextAccent{=}{OT1}{22}
282 \DeclareTextAccent{^}{OT1}{94}
283 \DeclareTextAccent{'}{OT1}{18}
284 \DeclareTextAccent{~}{OT1}{126}
285 \DeclareTextAccent{H}{OT1}{125}
286 \DeclareTextAccent{u}{OT1}{21}
287 \DeclareTextAccent{v}{OT1}{20}
288 \DeclareTextAccent{r}{OT1}{23}
```

Some accents have to be built by hand: Note that `\o@align` and `\o@lign` must be inside a group.

```
289 \DeclareTextCommand{\b}{OT1}[1]
290 {\hmode@bgroup\o@lignf\relax#1\crcr\hidewidth\sh@ft{29}%
291 \vbox to.2ex{\hbox{\char22}\vss}\hidewidth}\egroup}
292 \DeclareTextCommand{\c}{OT1}[1]
293 {\leavevmode\setbox\z@\hbox{\#1}\ifdim\ht\z@=1ex\accent24 #1%
294 \else{\o@align{\unhbox\z@\crcr\hidewidth\char24\hidewidth}}\fi}
295 \DeclareTextCommand{\d}{OT1}[1]
296 {\hmode@bgroup
297 \o@lign{\relax#1\crcr\hidewidth\sh@ft{10}.\hidewidth}\egroup}
```

Declare the text symbols.

```
298 \DeclareTextSymbol{\AE}{OT1}{29}
299 \DeclareTextSymbol{\OE}{OT1}{30}
300 \DeclareTextSymbol{\O}{OT1}{31}
301 \DeclareTextSymbol{\ae}{OT1}{26}
302 \DeclareTextSymbol{\i}{OT1}{16}
303 \DeclareTextSymbol{\j}{OT1}{17}
304 \DeclareTextSymbol{\oe}{OT1}{27}
305 \DeclareTextSymbol{\o}{OT1}{28}
306 \DeclareTextSymbol{\ss}{OT1}{25}
307 \DeclareTextSymbol{\textemdash}{OT1}{124}
308 \DeclareTextSymbol{\textendash}{OT1}{123}
```

Using the ligatures helps with OT1 fonts that have `\textexclamdown` and `\textquestiondown` in unusual positions.

```
309 \% \DeclareTextSymbol{\textexclamdown}{OT1}{60}
310 \% \DeclareTextSymbol{\textquestiondown}{OT1}{62}
311 \DeclareTextCommand{\textexclamdown}{OT1}{!`}
312 \DeclareTextCommand{\textquestiondown}{OT1}{?`}
313 \% \DeclareTextSymbol{\texthyphenchar}{OT1}{`-}
314 \% \DeclareTextSymbol{\texthyphen}{OT1}{`-}
315 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
316 \DeclareTextSymbol{\textquotedblright}{OT1}{`"}
```

```

317 \DeclareTextSymbol{\textquoteright}{OT1}{`}
318 \DeclareTextSymbol{\textquoteright}{OT1}{`}

```

Some symbols which are faked from others:

```

319 % \DeclareTextCommand{\aa}{OT1}
320 % {{\accent23{a}}}
321 \DeclareTextCommand{\L}{OT1}
322 {\leavevmode\setbox\z@\hbox{L}\hb@xt@wd{z@\hss\xxxii L}}
323 \DeclareTextCommand{\l}{OT1}
324 {\hmode@bgroup\xxxii l\egroup}
325 % \DeclareTextCommand{\AA}{OT1}
326 % {\leavevmode\setbox\z@\hbox{h}\dimen@ht\z@\advance\dimen@-1ex%
327 % \rlap{\raise.67\dimen@hbox{\char23}}A}

```

In the OT1 encoding Å has a hand-crafted definition, so we have here the first recorded explicit use of \DeclareTextCompositeCommand.

```

328 \DeclareTextCompositeCommand{\r}{OT1}{A}
329 {\leavevmode\setbox\z@\hbox{!}\dimen@ht\z@\advance\dimen@-1ex%
330 \rlap{\raise.67\dimen@hbox{\char23}}A}

```

In the OT1 encoding, £ and \$ share a slot.

```

331 \DeclareTextCommand{\textdollar}{OT1}{\hmode@bgroup
332 \ifdim \fontdimen@ne\font >\z@
333 \slshape
334 \else
335 \upshape
336 \fi
337 \char`\$\egroup}

338 \DeclareTextCommand{\textsterling}{OT1}{\hmode@bgroup
339 \ifdim \fontdimen@ne\font >\z@
340 \itshape
341 \else
342 \fontshape{ui}\selectfont
343 \fi
344 \char`\$\egroup}

```

Here we are adding some more composite commands to the OT1 encoding. This makes the use of certain accents with i compatible with their use with the T1 encoding; this enables them to become true L<sup>A</sup>T<sub>E</sub>X internal representations. However, it will make these accents work a little less fast since a check will always be made for the existence of a composite.

```

345 \DeclareTextComposite{\.{i}}{OT1}{`i}
346 \DeclareTextComposite{\.{i}}{OT1}{`i}{`i}
347 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge`i}
348 \DeclareTextCompositeCommand{\'}{OT1}{i}{\@tabacckludge`i}
349 \DeclareTextCompositeCommand{\^}{OT1}{i}{`^i}
350 \DeclareTextCompositeCommand{\"}{OT1}{i}{`^i}
351 </OT1>

```

## 19.6 Definitions for the T1 encoding

The definitions for the ‘Extended T<sub>E</sub>X text’ (T1) encoding.

Declare the encoding.

```

352 <*T1>
353 \DeclareFontEncoding{T1}{}{}

```

Declare the accents.

```

354 \DeclareTextAccent{'}{T1}{0}
355 \DeclareTextAccent{'}{T1}{1}
356 \DeclareTextAccent{^}{T1}{2}
357 \DeclareTextAccent{`}{T1}{3}
358 \DeclareTextAccent{"}{T1}{4}
359 \DeclareTextAccent{H}{T1}{5}
360 \DeclareTextAccent{r}{T1}{6}
361 \DeclareTextAccent{v}{T1}{7}
362 \DeclareTextAccent{u}{T1}{8}
363 \DeclareTextAccent{=}{T1}{9}
364 \DeclareTextAccent{.}{T1}{10}

```

Some accents have to be built by hand. Note that `\o@align` and `\o@lign` must be inside a group.

```

365 \DeclareTextCommand{\b}{T1}[1]
366 {\hmode@bgroup\o@lign{\relax#1\crcr\hidewidth\sh@ft{29}%
367 \vbox to .2ex{\hbox{\char9}\vss}\hidewidth}\egroup}
368 \DeclareTextCommand{\c}{T1}[1]
369 {\leavevmode\setbox\z@\hbox{\#1\ifdim\ht\z@=1ex\accent11 #1%
370 \else\o@align{\unhbox\z@\crcr

## 19.7 Definitions for the OMS encoding

The definitions for the ‘TEX math symbol’ (OMS) encoding. Even though this is meant to be a math font, it includes some of the standard LTEX text symbols.

Declare the encoding.

```

550 (*OMS)
551 \DeclareFontEncoding{OMS}{}{}

Declare the symbols.

552 % \changes{v1.99}{2004/02/02}{Added \cs{textbigcircle}}
553 % Note that slot 13 has in places been named |\Orb|: please root
554 % out and destroy this impolity wherever you find it!
555 % \begin{macrocode}
556 \DeclareTextSymbol{\textasteriskcentered}{OMS}{3} % "03
557 \DeclareTextSymbol{\textbackslash}{OMS}{110} % "6E
558 \DeclareTextSymbol{\textbar}{OMS}{106} % "6A
559 \DeclareTextSymbol{\textbardbl}{OMS}{107} % "6B
560 \DeclareTextSymbol{\textbraceleft}{OMS}{102} % "66
561 \DeclareTextSymbol{\textbraceright}{OMS}{103} % "67
562 \DeclareTextSymbol{\textbullet}{OMS}{15} % "0F
563 \DeclareTextSymbol{\textdaggerdbl}{OMS}{122} % "7A
564 \DeclareTextSymbol{\textdagger}{OMS}{121} % "79
565 \DeclareTextSymbol{\textparagraph}{OMS}{123} % "7B
566 \DeclareTextSymbol{\textperiodcentered}{OMS}{1} % "01
567 \DeclareTextSymbol{\textsection}{OMS}{120} % "78
568 \DeclareTextSymbol{\textbigcircle}{OMS}{13} % "0D
569 \DeclareTextCommand{\textcircled}{OMS}[1]{\hmode@bgroup
570 \ooalign{%
571 \hfil \raise .07ex\hbox {\upshape#1}\hfil \crcr
572 \char 13 % "0D
573 }%
574 \egroup}
575 </OMS>

```

## 19.8 Definitions for the OML encoding

The definitions for the ‘ $\text{\TeX}$  math italic’ (OML) encoding. Even though this is meant to be a math font, it includes some of the standard  $\text{\LaTeX}$  text symbols.

Declare the encoding.

```
576 (*OML)
577 \DeclareFontEncoding{OML}{}{}
```

Declare the symbols.

```
578 \DeclareTextSymbol{\textless}{OML}{`<}
579 \DeclareTextSymbol{\textgreater}{OML}{`>}
580 \DeclareTextAccent{\t}{OML}{127} % "7F
581
```

## 19.9 Definitions for the OT4 encoding

These definitions are for the Polish extension to the ‘ $\text{\TeX}$  text’ (OT1) encoding. This encoding was created by B. Jackowski and M. Ryćko for use with the Polish version of Computer Modern and Computer Concrete. In positions 0–127 it is identical to OT1 but it contains some additional characters in the upper half. The  $\text{\LaTeX}$  support was developed by Mariusz Olko.

The PL fonts that use it are available as follows:

Metafont sources <ftp://ftp.gust.org.pl/TeX/language/polish/pl-mf.zip>;  
Font files <ftp://ftp.gust.org.pl/TeX/language/polish/pl-tfm.zip>.

Declare the encoding.

```
582 (*OT4)
583 \DeclareFontEncoding{OT4}{}{}
584 \DeclareFontSubstitution{OT4}{cmr}{m}{n}
```

Declare the accents.

```
585 \DeclareTextAccent{"}{OT4}{127}
586 \DeclareTextAccent{'}{OT4}{19}
587 \DeclareTextAccent{.}{OT4}{95}
588 \DeclareTextAccent{=}{OT4}{22}
589 \DeclareTextAccent{^}{OT4}{94}
590 \DeclareTextAccent{'}{OT4}{18}
591 \DeclareTextAccent{~}{OT4}{126}
592 \DeclareTextAccent{H}{OT4}{125}
593 \DeclareTextAccent{u}{OT4}{21}
594 \DeclareTextAccent{v}{OT4}{20}
595 \DeclareTextAccent{r}{OT4}{23}
```

The ogonek accent is available only under a e A & E. But we have to provide some definition for  $\backslash k$ . Some other accents have to be built by hand as in OT1:

```
596 \DeclareTextCommand{\k}{OT4}[1]{%
597 \TextSymbolUnavailable{\k{#1}}#1
598 \DeclareTextCommand{\b}{OT4}[1]
599 {\hmode@bgroup\o@alignf\relax#1\crcr\hidewidth\sh@ft{29}%
600 \vbox to .2ex{\hbox{\char22}\vss}\hidewidth}\egroup
601 \DeclareTextCommand{\c}{OT4}[1]
602 {\leavevmode\setbox\z@\hbox{\ifdim\ht\z@=1ex\accent24 #1%
603 \else{\oalign{\unhbox\z@\crcr\hidewidth\char24\hidewidth}}\fi}
604 \DeclareTextCommand{\d}{OT4}[1]
605 {\hmode@bgroup
```

```
606 \o@lign{\relax#1\crcr\hidewidth\sh@ft{10}. \hidewidth}\egroup
```

Declare the text symbols.

```
607 \DeclareTextSymbol{\AE}{OT4}{29}
608 \DeclareTextSymbol{\OE}{OT4}{30}
609 \DeclareTextSymbol{\O}{OT4}{31}
610 \DeclareTextSymbol{\L}{OT4}{138}
611 \DeclareTextSymbol{\ae}{OT4}{26}
612 \DeclareTextSymbol{\guillemotleft}{OT4}{174}
613 \DeclareTextSymbol{\guillemotright}{OT4}{175}
614 \DeclareTextSymbol{\i}{OT4}{16}
615 \DeclareTextSymbol{\j}{OT4}{17}
616 \DeclareTextSymbol{\l}{OT4}{170}
617 \DeclareTextSymbol{\o}{OT4}{28}
618 \DeclareTextSymbol{\oe}{OT4}{27}
619 \DeclareTextSymbol{\quotedblbase}{OT4}{255}
620 \DeclareTextSymbol{\ss}{OT4}{25}
621 \DeclareTextSymbol{\textemdash}{OT4}{124}
622 \DeclareTextSymbol{\textendash}{OT4}{123}
623 \DeclareTextSymbol{\textexclamdown}{OT4}{60}
624 \% \DeclareTextSymbol{\texthyphenchar}{OT4}{`-}
625 \% \DeclareTextSymbol{\texthyphen}{OT4}{`-}
626 \DeclareTextSymbol{\textquestiondown}{OT4}{62}
627 \DeclareTextSymbol{\textquotedblleft}{OT4}{92}
628 \DeclareTextSymbol{\textquotedblright}{OT4}{`}
629 \DeclareTextSymbol{\textquotel}{OT4}{'`}
630 \DeclareTextSymbol{\textquoter}{OT4}{'`}
```

Definition for Å as in OT1:

```
631 \DeclareTextCompositeCommand{\r}{OT4}{A}
632 {\leavevmode\setbox\z@\hbox{!}\dimen@\ht\z@\advance\dimen@-1ex%
633 \rlap{\raise.67\dimen@\hbox{\char23}}A}
```

In the OT4 encoding, £ and \$ share a slot.

```
634 \DeclareTextCommand{\textdollar}{OT4}{\hmode@bgroup
635 \ifdim \fontdimen\@ne\font >\z@
636 \slshape
637 \else
638 \upshape
639 \fi
640 \char`\$\egroup}
641 \DeclareTextCommand{\textsterling}{OT4}{\hmode@bgroup
642 \ifdim \fontdimen\@ne\font >\z@
643 \itshape
644 \else
645 \fontshape{ui}\selectfont
646 \fi
647 \char`\$\egroup}
```

Declare the composites.

```
648 \DeclareTextComposite{\k}{OT4}{A}{129}
649 \DeclareTextComposite{\'}{OT4}{C}{130}
650 \DeclareTextComposite{\k}{OT4}{E}{134}
651 \DeclareTextComposite{\'}{OT4}{N}{139}
652 \DeclareTextComposite{\'}{OT4}{S}{145}
653 \DeclareTextComposite{\'}{OT4}{Z}{153}
```

```

654 \DeclareTextComposite{\.{OT4}{Z}{155}}
655 \DeclareTextComposite{\k.{OT4}{a}{161}}
656 \DeclareTextComposite{\'.{OT4}{c}{162}}
657 \DeclareTextComposite{\k.{OT4}{e}{166}}
658 \DeclareTextComposite{\'.{OT4}{n}{171}}
659 \DeclareTextComposite{\'.{OT4}{s}{177}}
660 \DeclareTextComposite{\'.{OT4}{z}{185}}
661 \DeclareTextComposite{\.{OT4}{z}{187}}
662 \DeclareTextComposite{\'.{OT4}{O}{211}}
663 \DeclareTextComposite{\'.{OT4}{o}{243}}
664
```

## 19.10 Definitions for the TS1 encoding

```

665 <*TS1>
666 \DeclareFontEncoding{TS1}{}{}
667 \DeclareFontSubstitution{TS1}{cmr}{m}{n}

```

Some accents have to be built by hand. Note that `\o@align` and `\o@lign` must be inside a group.

```

668 \DeclareTextCommand{\capitalcedilla}{TS1}[1]
669 {\hmode@bgroup
670 \oalign{\null#1\crcr\hidewidth\char11\hidewidth}\egroup}
671 \DeclareTextCommand{\capitalogonek}{TS1}[1]
672 {\hmode@bgroup
673 \oalign{\null#1\crcr\hidewidth\char12\hidewidth}\egroup}

```

Accents for capital letters.

These commands can be used by the end user either directly or through definitions of the type

```
\DeclareTextCompositeCommand{\'.{T1}{X}{\capitalacute X}}
```

None of the latter definitions are provided by default, since they are probably rarely used.

”00 = 0

```

674 \DeclareTextAccent{\capitalgrave}{TS1}{0}
675 \DeclareTextAccent{\capitalacute}{TS1}{1}
676 \DeclareTextAccent{\capitalcircumflex}{TS1}{2}
677 \DeclareTextAccent{\capitaltilde}{TS1}{3}
678 \DeclareTextAccent{\capitaldieresis}{TS1}{4}
679 \DeclareTextAccent{\capitalhungarumlaut}{TS1}{5}
680 \DeclareTextAccent{\capitalring}{TS1}{6}
681 \DeclareTextAccent{\capitalcaron}{TS1}{7}

”08 = 8

682 \DeclareTextAccent{\capitalbreve}{TS1}{8}
683 \DeclareTextAccent{\capitalmacron}{TS1}{9}
684 \DeclareTextAccent{\capitaldotaccent}{TS1}{10}

```

Tie accents.

The tie accent was borrowed from the `cmmi` font. The `tc` fonts now provide four tie accents, the first two are done in the classical way with assymetric glyphs hanging out of their boxes; the new ties are centered in their boxes like all other accents. They need a name: please tell us if you know what to call them.

```

" =
685 \DeclareTextAccent{\t}{TS1}{26}
686 \DeclareTextAccent{\capitaltie}{TS1}{27}
687 \DeclareTextAccent{\newtie}{TS1}{28}
688 \DeclareTextAccent{\capitalnewtie}{TS1}{29}

 Compund word marks.
 The text companion fonts contain two compound word marks of different
 heights, one has cap_height, the other asc_height.
689 \DeclareTextSymbol{\textcapitalcompwordmark}{TS1}{23}
690 \DeclareTextSymbol{\textascendercompwordmark}{TS1}{31}

 The text companion symbols.

691 \DeclareTextSymbol{\textquotestraightbase}{TS1}{13}
"10 = 16
692 \DeclareTextSymbol{\textquotestraightdblbase}{TS1}{18}
693 \DeclareTextSymbol{\texttwelveudash}{TS1}{21}
694 \DeclareTextSymbol{\textthreequartersemdash}{TS1}{22}
"18 = 24
695 \DeclareTextSymbol{\textleftarrow}{TS1}{24}
696 \DeclareTextSymbol{\textrightarrow}{TS1}{25}
"20 = 32
697 \DeclareTextSymbol{\textblank}{TS1}{32}
698 \DeclareTextSymbol{\textdollar}{TS1}{36}
699 \DeclareTextSymbol{\textquotesingle}{TS1}{39}
"28 = 40
700 \DeclareTextSymbol{\textasteriskcentered}{TS1}{42}

 Note that '054 is a comma and '056 is a full stop: these make numbers using
 oldstyle digits easier to input.
701 \DeclareTextSymbol{\textdblhyphen}{TS1}{45}
702 \DeclareTextSymbol{\textfractionsolidus}{TS1}{47}

 Oldstyle digits.
"30 = 48
703 \DeclareTextSymbol{\textzerooldstyle}{TS1}{48}
704 \DeclareTextSymbol{\textoneoldstyle}{TS1}{49}
705 \DeclareTextSymbol{\texttwooldstyle}{TS1}{50}

## 20 Package files

This file now also contains some packages that provide access to the more specialised encodings.

### 20.1 The fontenc package

This package allows authors to specify which encodings they will use. For each encoding `FOO`, the package looks to see if the encoding `FOO` has already been declared. If it has not, the file `fooenc.def` is loaded. The default encoding is set to be `FOO`.

In addition the package at the moment contains extra code to extend the `\@uclclist` (list of upper/lower case pairs) for encodings that involve cyrillic characters. THIS IS A TEMPORARY SOLUTION and will not stay this way forever (or so we hope) but right now we are missing a proper interface for this and didn't wanted to rush it.

```
805 (*package)
```

Here we define a macro that extends the `\@uclclist` if needed and afterwards turns itself in a noop.

```

806 \def\update@uclc@with@cyrillic{%
807 \expandafter\def\expandafter\@uclclist\expandafter
808 {@\uclclist
809 \cyra\CYRA\cyrabhch\CYRABHCH\cyrabhchdsc\CYRABHCHDSC\cyrabhdze

833 \cyyzhdsc\CYRZHDSC}%
834 \let\update@uclc@with@cyrillic\relax
835 }

```

Here we process each option:

```

836 \DeclareOption*{%
837 \let\encodingdefault\CurrentOption
838 \edef\reserved@f{%
839 \lowercase{\def\noexpand\reserved@f{\CurrentOption enc.def}}%
840 \reserved@f
841 \InputIfFileExists\reserved@f
842 {}{\PackageError{fontenc}{%
843 Encoding file '\reserved@f' not found.%\\
844 \MessageBreak
845 You might have misspelt the name of the encoding}%
846 {Necessary code for this encoding was not
847 loaded.\MessageBreak
848 Thus calling the encoding later on will
849 produce further error messages.}}%
850 \let\reserved@f\relax

```

In case the current encoding is one of a list of known cyrillic ones we extend the \uclclist:

```

851 \expandafter\in@\expandafter{\CurrentOption}%
852 {T2A,T2B,T2C,X2,LCY,OT2}%
853 \ifin@

```

But only if it hasn't already been extended. This might happen if there are several calls to fontenc loading one of the above encodings. If we don't do this check the \uclclist gets unnecessarily big, slowing down the processing at runtime.

```

854 \expandafter\in@\expandafter\cyyra\expandafter
855 {\uclclist}%
856 \ifin@
857 \else
858 \update@uclc@with@cyrillic
859 \fi
860 \fi
861 }

```

```

862 \ProcessOptions*
863 \fontencoding\encodingdefault\selectfont
 To save some space we get rid of the macro extending the \@uclclist (might
 have happened already).
864 \let\update@uclc@with@cyrillic\relax
 Finally we pretend that the fontenc package wasn't read in. This allows for
 using it several times, e.g., in a class file and in the preamble (at the cost of not
 getting any version info). That kind of hackery shows that using a general purpose
 package just for loading an encoding is not the right kind of interface for setting
 up encodings — it will get replaced at some point in the future.
865 \global\expandafter\let\csname ver@fontenc.sty\endcsname\relax
866 \global\expandafter\let\csname opt@fontenc.sty\endcsname\relax
867 \global\let\@ifl@ter@@\@ifl@ter
868 \def\@ifl@ter#1#2#3#4#5{\global\let\@ifl@ter\@ifl@ter@@}
869
```

## 20.2 The textcomp package

This one is for the TS1 encoding which contains text symbols for use with the T1-encoded text fonts. It therefore first inputs the file `TS1enc.def` and then sets (or resets) the defaults for the symbols it contains. The result of this is that when one of these symbols is accessed and the current encoding does not provide it, the symbol will be supplied by a silent, local change to this encoding.

```
870 <*TS1sty>
```

Since many PostScript fonts only implement a subset of TS1 many commands only produce black blobs of ink. To resolve the resulting problems a number of options have been introduced and some code has been developed to distinguish sub-encodings.

The sub-encodings have a numerical id and are defined as follows for TS1:

**#5** those TS1 symbols that are also in the ISO-Adobe character set; without `\textcurrency`, which is often misused for the Euro. Older Type1 fonts from the non-T<sub>E</sub>X world provide only this subset.

**#4** = #5 + `\texteuro`. Most newer fonts provide this.

**#3** = #4 + `\textomega`. Can also be described as  $TS1 \cap (ISO\text{-}Adobe \cup MacRoman)$ . (Except for the missing "currency".)

**#2** = #3 + `\textestimated` + `\textcurrency`. Can also be described as  $TS1 \cap Adobe\text{-}Western\text{-}2$ . This may be relevant for OpenType fonts, which usually show the Adobe-Western-2 character set.

**#1** = TS1 without `\textcircled` and `\t`. These two glyphs are often not implemented and if their kernel defaults are changed commands like `\copyright` unnecessarily fail.

**#0** = full TS1

And here a summary to go in the transcript file:

```
871 \PackageInfo{textcomp}{Sub-encoding information:\MessageBreak
872 \space\space 5 = only ISO-Adobe without \string\textcurrency\MessageBreak
873 \space\space 4 = 5 + \string\texteuro\MessageBreak
874 \space\space 3 = 4 + \string\textohm\MessageBreak
875 \space\space 2 = 3 + \noexpand\textestimated+ \string\textcurrency\MessageBreak
876 \space\space 1 = TS1 - \noexpand\textcircled- \string\t\MessageBreak
877 \space\space 0 = TS1 (full)\MessageBreak
878 Font families with sub-encoding setting implement\MessageBreak
879 only a restricted character set as indicated.\MessageBreak
880 Family '?' is the default used for unknown fonts.\MessageBreak
881 See the documentation for details@\gobble}
```

`\DeclareEncodingSubset` An encoding subset to which a font family belongs is declared by `\DeclareEncodingSubset` that take the major encoding as the first argument (e.g., `TS1`), the family name as the second argument (e.g., `cmtt`), and the subset encoding id as a third, (e.g., `0` for `cmtt`).

The default encoding subset to use when nothing is known about the current font family is named `?`.

```
882 \def\DeclareEncodingSubset#1#2#3{%
883 \@ifundefined{#1:#2}{%
884 {\PackageInfo{textcomp}{Setting #2 sub-encoding to #1/#3}}%
885 {\PackageInfo{textcomp}{Changing #2 sub-encoding to #1/#3}}%
886 \@namedef{#1:#2}{#3}%
887 }@\onlypreamble\DeclareEncodingSubset
```

The options for the package are the following:

**safe** for unknown font families enables only symbols that are also in the ISO-Adobe character set; without "currency", which is often misused for the Euro. Older Type1 fonts from the non-TeX world provide only this subset.

**euro** enables the "safe" symbols plus the `\texteuro` command. Most newer fonts provide this.

**full** enables all `TS1` commands; useful only with fonts like EC or CM bright.

**almostfull** same as "full", except that `\textcircled` and `\t` are *not* redefined from their defaults to avoid that commands like `\copyright` suddenly no longer work.

**force** ignore all subset encoding definitions stored in the package itself or in the configuration file and always use the default subset as specified by one of the other options (seldom useful, only dangerous).

`\iftc@forced` Switch used to implement the **force** option

```
888 \newif\iftc@forced \tc@forcedfalse
```

This is implemented by defining the default subset:

```
889 \DeclareOption{full}{\DeclareEncodingSubset{TS1}{?}{0}}
890 \DeclareOption{almostfull}{\DeclareEncodingSubset{TS1}{?}{1}}
891 \DeclareOption{euro}{\DeclareEncodingSubset{TS1}{?}{4}}
892 \DeclareOption{safe}{\DeclareEncodingSubset{TS1}{?}{5}}
```

The default is “almostfull” which means that old documents will work except that `\textcircled` and `\t` will use the kernel defaults (with the advantage that this also works if the current font (as often the case) doesn’t implement these glyphs.

The “force” option simply sets the switch to true.

```
893 \DeclareOption{force}{\tc@forcedtrue}
```

The suggestions to user is to use the “safe” option always unless that balks in which case they could switch to “almostfull” but then better check their output manually.

```
894 \def\tc@errorwarn{\PackageError}
895 \DeclareOption{warn}{{\gdef\tc@errorwarn{\#1\#2\#3{\PackageWarning{\#1}{\#2}}}}
896 \ExecuteOptions{almostfull}
897 \ProcessOptions\relax
```

`\CheckEncodingSubset` The command `\CheckEncodingSubset` will check if the current font family has the right encoding subset to typeset a certain command. It takes five arguments as follows: first argument is either `\UseTextSymbol`, `\UseTextAccent` depending on whether or not the symbol is a text symbol or a text accent.

The second argument is the encoding from which this symbol should be fetched.

The third argument is either a fake accessor command or an error message. the code in that argument (if ever executed) receives two arguments: #2 and #5 of `\CheckEncodingSubset`.

Argument four is the subset encoding id to test against: if this value is higher than the subset id of the current font family then we typeset the symbol, i.e., execute `\#1{\#2}\#5` otherwise it runs `\#3\#5`, e.g., to produce an error message or fake the glyph somehow.

Argument five is the symbol or accent command that is being checked.

For usage examples see definitions below.

```
898 \iftc@forced
```

If the “force” option was given we always use the default for testing against.

```
899 \def\CheckEncodingSubset#1#2#3#4#5{%
900 \ifnum #4>%
901 0\csname #2:?\endcsname
902 \relax
903 \expandafter\@firstoftwo
904 \else
905 \expandafter\@secondoftwo
906 \fi
907 {\#1{\#2}}{\#3}%
908 \#5%
909 }
```

In normal circumstances the test is a bit more complicated: first check if there exists a macro `\arg2`:*<current-family>* and if so use that value to test against, otherwise use the default to test against.

```
910 \else
911 \def\CheckEncodingSubset#1#2#3#4#5{%
912 \ifnum #4>%
913 \expandafter\ifx\csname #2:\f@family\endcsname\relax
914 0\csname #2:?\endcsname
915 \else
```

```

916 \csname #2:\f@family\endcsname
917 \fi
918 \relax
919 \expandafter\@firstoftwo
920 \else
921 \expandafter\@secondoftwo
922 \fi
923 {#1{#2}}{#3}%
924 #5%
925 }
926 \fi

tc@subst
927 \def\tc@subst#1{%
928 \tc@errorwarn{textcomp}%
929 {Symbol \string#1 not provided by\MessageBreak
930 font family \f@family\space
931 in TS1 encoding.\MessageBreak Default family used instead}\@eha
932 \bgroup\fontfamily{textcompsubstdefault}\selectfont#1\egroup
933 }

\textracompsubstdefault
934 \def\textracompsubstdefault{cmr}

\tc@error \tc@error is going to be used in arg #3 of \CheckEncodingSubset when a symbol
is not available in a certain font family. It gets pass the encoding it normally lives
in (arg one) and the name of the symbol or accent that has a problem.

935 % error commands take argument:
936 % #1 symbol to be used
937 \def\tc@error#1{%
938 \PackageError{textcomp}%
939 {Accent \string#1 not provided by\MessageBreak
940 font family \f@family\space
941 in TS1 encoding}\@eha
942 }

\tc@fake@euro \tc@fake@euro is an example of a “fake” definition to use in arg #3 of
\CheckEncodingSubset when a symbol is not available in a certain font family.
Here we produce an Euro symbol by combining a “C” with a “=”.

943 \def\tc@fake@euro#1{%

1053 \DeclareTextCommandDefault{\textleaf}{\tc@check@symbol2\textleaf}
1054 \DeclareTextCommandDefault{\textmarried}{\tc@check@symbol2\textmarried}
1055 \DeclareTextCommandDefault{\textmusicalnote}{\tc@check@symbol2\textmusicalnote}
1056 \DeclareTextCommandDefault{\textdblhyphenchar}{\tc@check@symbol2\textdblhyphenchar}
1057 \DeclareTextCommandDefault{\textdollaroldstyle}{\tc@check@symbol2\textdollaroldstyle}
1058 \DeclareTextCommandDefault{\textcentoldstyle}{\tc@check@symbol2\textcentoldstyle}
1059 \DeclareTextCommandDefault{\textcolonmonetary}{\tc@check@symbol2\textcolonmonetary}
1060 \DeclareTextCommandDefault{\textwon}{\tc@check@symbol2\textwon}
1061 \DeclareTextCommandDefault{\textnaira}{\tc@check@symbol2\textnaira}
1062 \DeclareTextCommandDefault{\textguarani}{\tc@check@symbol2\textguarani}
1063 \DeclareTextCommandDefault{\textpeso}{\tc@check@symbol2\textpeso}
1064 \DeclareTextCommandDefault{\textlira}{\tc@check@symbol2\textlira}
1065 \DeclareTextCommandDefault{\textrecipe}{\tc@check@symbol2\textrecipe}
1066 \DeclareTextCommandDefault{\textinterrobang}{\tc@check@symbol2\textinterrobang}
1067 \DeclareTextCommandDefault{\textinterrobangdown}{\tc@check@symbol2\textinterrobangdown}
1068 \DeclareTextCommandDefault{\textdong}{\tc@check@symbol2\textdong}
1069 \DeclareTextCommandDefault{\textpertenthousand}{\tc@check@symbol2\textpertenthousand}
1070 \DeclareTextCommandDefault{\textpilcrow}{\tc@check@symbol2\textpilcrow}
1071 \DeclareTextCommandDefault{\textbaht}{\tc@check@symbol2\textbaht}
1072 \DeclareTextCommandDefault{\textnumero}{\tc@check@symbol2\textnumero}
1073 \DeclareTextCommandDefault{\textdiscount}{\tc@check@symbol2\textdiscount}
1074 \DeclareTextCommandDefault{\textopenbullet}{\tc@check@symbol2\textopenbullet}
1075 \DeclareTextCommandDefault{\textservicemark}{\tc@check@symbol2\textservicemark}
1076 \DeclareTextCommandDefault{\textlquill}{\tc@check@symbol2\textlquill}
1077 \DeclareTextCommandDefault{\textrquill}{\tc@check@symbol2\textrquill}
1078 \DeclareTextCommandDefault{\textcopyleft}{\tc@check@symbol2\textcopyleft}
1079 \DeclareTextCommandDefault{\textcircledP}{\tc@check@symbol2\textcircledP}
1080 \DeclareTextCommandDefault{\textreferencemark}{\tc@check@symbol2\textreferencemark}
1081 \DeclareTextCommandDefault{\textsurd}{\tc@check@symbol2\textsurd}

```

The `\textcircled` and `\t` are handled specially, unless the current font has a subset id of 0 (i.e. full TS1) we pick the symbols up from the the math font encodings, i.e., the third argument to `\CheckEncodingSubset` uses `\UseTextAccent` to get them from there.

```

1082 \DeclareTextCommandDefault{\textcircled}{%
1083 \CheckEncodingSubset\UseTextAccent{TS1}\{\UseTextAccent{OMS}\}1\textcircled}
1084 \DeclareTextCommandDefault{\t}{%
1085 \CheckEncodingSubset\UseTextAccent{TS1}\{\UseTextAccent{OML}\}1\t}

```

Finally input the encoding-specific definitions for TS1 thus making the top-level definitions optimised for this encoding (and not for the default encoding, see section 19.2).

```
1086 \input{ts1enc.def}
```

Now having the new glyphs available we also want to make sure that they are used. For most cases this will automatically happen but for some glyphs there are inferior definitions already known to L<sup>A</sup>T<sub>E</sub>X which will prevent the usage of the TS1 versions (see section 19.1 above). So we better get rid of them:

```
1087 \UndeclareTextCommand{\textsterling}{OT1}
1088 \UndeclareTextCommand{\textdollar} {OT1}
```

Similar declarations should probably be made for other encodings like OT4 if they are in use.

```
1089 %\UndeclareTextCommand{\textsterling}{OT4}
1090 %\UndeclareTextCommand{\textdollar} {OT4}
```

From the T1 encoding there are two candidates for removal: %<sub>0</sub> and %<sub>00</sub> since these are both constructed from % followed by a tiny ‘<sub>0</sub>’ rather than being a single glyph. The problem with this approach is that in PostScript fonts this small zero is usually not available resulting in %■ rather than %<sub>0</sub> while the real glyph (at least for \textperthousand) is available in the PostScript version of TS1. So for the moment we compromise by removing the T1 declaration for \textperthousand but keeping the one for \textpertenthousand. This will have the effect that with Computer Modern fonts everything will come out (although %<sub>0</sub> and %<sub>00</sub> are not taken from the same physical font) and with PostScript fonts %<sub>0</sub> will come out correctly while %<sub>00</sub> will most likely look like %■ — which is probably an improvement over just getting a single ‘■’ to indicate a completely missing glyph, which would happen if we also ‘undeclared’ \textpertenthousand.

```
1091 \UndeclareTextCommand{\textperthousand}{T1}
1092 %\UndeclareTextCommand{\textpertenthousand}{T1}
```

### 20.2.1 Supporting oldstyle digits

```
1093 \DeclareRobustCommand\oldstylenums[1]{%
1094 \begingroup
1095 \ifmmode
1096 \mathgroup\symletters #1%
1097 \else
1098 \CheckEncodingSubset@\use@text@encoding{TS1}%
1099 {\PackageWarning{textcomp}%
1100 {Oldstyle digits unavailable for
1101 family \f@family.\MessageBreak
1102 Lining digits used instead}%
1103 \tw@{#1}%
1104 \fi
1105 \endgroup
1106 }
```

### 20.2.2 Subset encoding defaults

For many font families commonly used in the T<sub>E</sub>X world we provide the subset encoding data here. Users can add additional font families in the file `textcomp.cfg` if they own other fonts.

However, if the option “forced” was given then all subset encoding specifications are ignored, so there is no point in setting any of them up:

```
1107 \iftc@forced \else
```

Computer modern based fonts (e.g., CM, CM-Bright, Concrete):

```
1108 \DeclareEncodingSubset{TS1}{cmr} {0}
1109 \DeclareEncodingSubset{TS1}{cmss} {0}
1110 \DeclareEncodingSubset{TS1}{cmtt} {0}
1111 \DeclareEncodingSubset{TS1}{cmvtt} {0}
1112 \DeclareEncodingSubset{TS1}{cmbr} {0}
1113 \DeclareEncodingSubset{TS1}{cmtl} {0}
1114 \DeclareEncodingSubset{TS1}{ccr} {0}
```

PSNFSS fonts:

```
1115 \DeclareEncodingSubset{TS1}{ptm} {4}
1116 \DeclareEncodingSubset{TS1}{pcr} {4}
1117 \DeclareEncodingSubset{TS1}{phv} {4}
1118 \DeclareEncodingSubset{TS1}{ppl} {3}
1119 \DeclareEncodingSubset{TS1}{pag} {4}
1120 \DeclareEncodingSubset{TS1}{pbk} {4}
1121 \DeclareEncodingSubset{TS1}{pnc} {4}
1122 \DeclareEncodingSubset{TS1}{pzc} {4}
1123 \DeclareEncodingSubset{TS1}{bch} {4}
1124 \DeclareEncodingSubset{TS1}{put} {5}
```

Other CTAN fonts (probably not complete):

```
1125 \DeclareEncodingSubset{TS1}{uag} {5}
1126 \DeclareEncodingSubset{TS1}{ugq} {5}
1127 \DeclareEncodingSubset{TS1}{ul8} {4}
1128 \DeclareEncodingSubset{TS1}{ul9} {4} % (LuxiSans, one day)
1129 \DeclareEncodingSubset{TS1}{augie} {5}
1130 \DeclareEncodingSubset{TS1}{dayrom} {3}
1131 \DeclareEncodingSubset{TS1}{dayroms} {3}
1132 \DeclareEncodingSubset{TS1}{pxr} {0}
1133 \DeclareEncodingSubset{TS1}{pxss} {0}
1134 \DeclareEncodingSubset{TS1}{pxtt} {0}
1135 \DeclareEncodingSubset{TS1}{txr} {0}
1136 \DeclareEncodingSubset{TS1}{txss} {0}
1137 \DeclareEncodingSubset{TS1}{txtt} {0}
```

Fourier-GUTenberg:

```
1138 \DeclareEncodingSubset{TS1}{futs} {4}
1139 \DeclareEncodingSubset{TS1}{futx} {4}
1140 \DeclareEncodingSubset{TS1}{futj} {4}
```

Y&Y's Lucida Bright

```
1141 \DeclareEncodingSubset{TS1}{hlh} {3}
1142 \DeclareEncodingSubset{TS1}{hls} {3}
1143 \DeclareEncodingSubset{TS1}{hlst} {3}
```

The remaining settings for Lucida are conservative: the following fonts contain the `\textohm` character but not the `\texteuro`, i.e., belong to neither subset 4 nor subset 3. If you want to use the `\textohm` with these fonts copy these definition to `textcomp.cfg` and change the subset to 3. However in that case make sure that you do not use the `\texteuro`.

```
1144 \DeclareEncodingSubset{TS1}{hlct} {5}
1145 \DeclareEncodingSubset{TS1}{hlx} {5}
1146 \DeclareEncodingSubset{TS1}{hlce} {5}
1147 \DeclareEncodingSubset{TS1}{hlcn} {5}
```

```
1148 \DeclareEncodingSubset{TS1}{hlcw} {5}
1149 \DeclareEncodingSubset{TS1}{hlcf} {5}
```

Other commercial families...

```
1150 \DeclareEncodingSubset{TS1}{pplx} {3}
1151 \DeclareEncodingSubset{TS1}{pplj} {3}
1152 \DeclareEncodingSubset{TS1}{ptmx} {4}
1153 \DeclareEncodingSubset{TS1}{ptmj} {4}
```

If the file `textcomp.cfg` exists it will be loaded at this point. This allows to define further subset encodings for font families not covered by default.

```
1154 \InputIfFileExists{textcomp.cfg}
1155 {\PackageInfo{textcomp}{Local configuration file used}{}
1156 \fi
1157 /TS1sty}
```

# File m

## ltcounts.dtx

### 21 Counters and Lengths

Commands for defining and using counters. This file defines:

|                 |                                                                                                                                                                   |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \newcounter     | To define a new counter.                                                                                                                                          |
| \setcounter     | To set the value of counters.                                                                                                                                     |
| \addtocounter   | Increase the counter #1 by the number #2.                                                                                                                         |
| \stepcounter    | Increase a counter by one.                                                                                                                                        |
| \refstepcounter | Increase a counter by one, also setting the value used by \label.                                                                                                 |
| \value          | For accessing the value of the counter as a T <sub>E</sub> X number (as opposed to \the<counter> which expands to the <i>printed</i> representation of <counter>) |
| \arabic         | \arabic{<counter>}: 1, 2, 3, ...                                                                                                                                  |
| \roman          | \roman{<counter>}: i, ii, iii, ...                                                                                                                                |
| \Roman          | \Roman{<counter>}: I, II, III, ...                                                                                                                                |
| \alph           | \alph{<counter>}: a, b, c, ...                                                                                                                                    |
| \Alpha          | \Alpha{<counter>}: A, B, C, ...                                                                                                                                   |
| \fnsymbol       | \fnsymbol{<counter>}: *, †, ‡, ...                                                                                                                                |
|                 | 1 (*2ekernel)                                                                                                                                                     |

#### 21.1 Environment Counter Macros

An environment foo has an associated counter defined by the following control sequences:

|         |                                                                                                                                                                                                                                                        |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \c@foo  | Contains the counter's numerical value. It is defined by \newcount\foocount.                                                                                                                                                                           |
| \thefoo | Macro that expands to the printed value of \foocount. For example, if sections are numbered within chapters, and section headings look like Section II-3. The Nature of Counters then \thesection might be defined by:                                 |
|         | \def\thesection                                                                                                                                                                                                                                        |
|         | {\@Roman{\c@chapter}-\@arabic{\c@section}}                                                                                                                                                                                                             |
| \p@foo  | Macro that expands to a printed 'reference prefix' of counter foo. Any \ref to a value created by counter foo will produce the expansion of \p@foo\thefoo when the \label command is executed. See file ltxref.dtx for an extension of this mechanism. |
| \cl@foo | List of counters to be reset when foo stepped. Has format \c@elt{counter_a}\c@elt{counter_b}\c@elt{counter_c}.                                                                                                                                         |

#### NOTE:

\thefoo and \p@foo must be defined in such a way that \edef\bar{\thefoo} or \edef\bar{\p@foo} defines \bar so that it will evaluate to the counter value at the time of the \edef, even after \foocount and any other counters have been changed. This will happen if you use the standard commands \arabic, \Roman, etc.

The following commands are used to define and modify counters.

```

\refstepcounter{\⟨foo⟩}
Same as \stepcounter, but it also defines \currentreference so that a subsequent \label{⟨bar⟩} command causes \ref{⟨bar⟩} to generate the current value of counter ⟨foo⟩.

\@definecounter{\⟨foo⟩}
Initializes counter {⟨foo⟩} (with empty reset list), defines \p@foo and \thefoo to be null. Also adds ⟨foo⟩ to \cl@ckpt – the reset list of a dummy counter @ckpt used for taking checkpoints for the \include system.

\@addtoreset{\⟨foo⟩}{⟨bar⟩} : Adds counter ⟨foo⟩ to the list of counters \cl@bar to be reset when counter ⟨bar⟩ is stepped.

\setcounter \setcounter{\⟨foo⟩}{⟨val⟩} : Globally sets \foocounter equal to ⟨val⟩.

2 \def\setcounter#1#2{%
3 \@ifundefined{c@#1}{%
4 {\@nocounterr{#1}}{%
5 {\global\csname c@#1\endcsname#2\relax}}}}}

\addtocounter \addtocounter{\⟨foo⟩}{⟨val⟩} Globally increments \foocounter by ⟨val⟩.

6 \def\addtocounter#1#2{%
7 \@ifundefined{c@#1}{%
8 {\@nocounterr{#1}}{%
9 {\global\advance\csname c@#1\endcsname #2\relax}}}}}

\newcounter \newcounter{\⟨newctr⟩}[⟨oldctr⟩] Defines ⟨newctr⟩ to be a counter, which is reset when counter ⟨oldctr⟩ is stepped. If ⟨newctr⟩ already defined produces ‘c@newctr already defined’ error.

10 \def\newcounter#1{%
11 \expandafter\@ifdefinable\csname c@#1\endcsname{%
12 {\@definecounter{#1}}}{%
13 {\@ifnextchar[{\@newctr{#1}}{}}}}}

\value \value{\⟨ctr⟩} produces the value of counter ⟨ctr⟩, for use with a \setcounter or \addtocounter command.

14 \def\value#1{\csname c@#1\endcsname}

\@newctr

15 \def\@newctr#1[#2]{%
16 \@ifundefined{c@#2}{%
17 {\@nocounterr{#2}}{%
18 {\@addtoreset{#1}{#2}}}}}

\stepcounter \stepcounterfoo Globally increments counter \c@FOO and resets all subsidiary counters.

19 \def\stepcounter#1{%
20 \addtocounter{#1}\@ne
21 \begingroup
22 \let\@elt\@stpelt
23 \csname cl@#1\endcsname
24 \endgroup}

\@stpelt

25 \def\@stpelt#1{\global\csname c@#1\endcsname \z@}

| \@settopoint | This macro takes the contents of the skip register that is supplied as its argument and removes the fractional part to make it a whole number of points. This can be used in class files to avoid values like 345.466666pt when calculating a dimension. |
|              | 11 \def\@settopoint#1{\divide#1\p@\multiply#1\p@}                                                                                                                                                                                                        |
|              | 12                                                                                                                                                                                                                                                       |

## File o ltfssbas.dtx

This file contains the main implementation of the ‘low level’ font selection commands. See other parts of the L<sup>A</sup>T<sub>E</sub>X distribution, or *The L<sup>A</sup>T<sub>E</sub>X Companion* for higher level documentation of the L<sup>A</sup>T<sub>E</sub>X ‘New’ Font Selection Scheme.

**Warning:** The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

### 23 Autoloading parts of NFSS

This code is set up in a way that some parts of it can be kept separate and will only be loaded if needed.

If we are producing an autoload version of L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> then all those parts with `def1` or `def2` docstrip guards will be placed into the autoloadable files `autofss1.sty` and `autofss2.sty`.

The ‘2ekernel’ code ensures that a `\usepackage{autofss1}` is essentially ignored if a ‘full’ format is being used that has picture mode already in the format.

Note the `autofss2` loading is currently disabled.

```
1 <2ekernel>\expandafter\let\csname ver@autofss1.sty\endcsname\fmtversion
```

The autoload file `autofss2` is a specialty because it contains code which will be completely local, ie loaded every time again.

### 24 Preliminary macros

We define a number of macros that will be used later.

`\@nomath` `\@nomath` is used by most macros that will have no effect in math mode. It issues a warning message.

```
2 <*2ekernel | autoload>
3 \def\@nomath#1{\relax\ifmmode
4 \@font@warning{Command \noexpand#1 invalid in math mode}\fi}
5 </2ekernel | autoload>
```

`\no@alphabet@error` The macro `\no@alphabet@error` is called whenever the user requests a math *alphabet* that is not available in the current *version*. In math mode an error message is produced otherwise the command keeps silent. The argument is the name of the control sequence that identifies the math *alphabet*. The `\relax` at the beginning is necessary to prevent T<sub>E</sub>X from scanning too far in certain situations.

```
6 <*2ekernel | def1>
7 \gdef\no@alphabet@error#1{\relax \ifmmode
8 \@latex@error{Math\space alphabet\space identifier\space
9 \noexpand#1 is\space undefined\space in\space math\space
10 version\space '\math@version'}%
```

```

11 {Your\space requested\space math\space alphabet\space
12 is\space undefined\space in\space the\space current\space
13 math\space version.^^JCheck\space the\space spelling\space
14 or\space use\space the\space \noexpand\SetMathAlphabet\space
15 command.}
16 \fi}
17 </2ekernel | def1>
18 {*autoload}
19 \gdef\no@alphabet@error{\relax \ifmmode
20 \expandafter\try@sizes\expandafter\no@alphabet@error \fi}
21 </autoload>
```

\new@mathgroup \mathgroup We also give a new name to \newfam and \fam to avoid verbal confusion (see the introduction).<sup>2</sup>

```

22 <2ekernel | autoload>
23 \def\new@mathgroup{\alloc@8\mathgroup\chardef\sixt@@n}
24 \let\mathgroup\fam
25 \let\newfam\new@mathgroup
26 \onlypreamble\new@mathgroup
```

## 25 Macros for setting up the tables

\DeclareFontShape The macro \DeclareFontShape takes 6 arguments:

```
27 \def\DeclareFontShape{\begingroup
```

First we restore the catcodes of all characters used in the syntax.

```
28 \nfss@catcodes
```

We use \expandafter \endgroup to restore catcode in case something goes wrong with the argument parsing (suggested by Tim Van Zandt)

\DeclareFontShape

```

29 \expandafter\endgroup
30 \DeclareFontShape@}
31 \def\DeclareFontShape@#1#2#3#4#5#6{%
32 \expandafter\ifx\csname #1+#2\endcsname\relax
33 @latex@error{Font family '#1+#2' unknown}\@eha
34 \else
35 \expandafter
36 \xdef\csname#1/#2/#3/#4\endcsname{\expandafter\noexpand
37 \csname #5\endcsname}%
38 \def\reserved@a{#6}%
39 \global
40 \expandafter\let\csname#5\expandafter\endcsname
41 \ifx\reserved@a\empty
42 \empty
43 \else
44 \reserved@a
45 \fi
46 \fi
47 }
```

---

<sup>2</sup>For the same reason it seems advisable to \let\fam and \newfam equal to \relax, but this is commented out to retain compatibility to existing style files.

```

\DeclareFixedFont Define a direct font switch that avoids all overhead.
48 \def\DeclareFixedFont#1#2#3#4#5#6{%
49 \begingroup
50 \math@fontsfals

79 }
```

Now we have to define the macro  $\langle \#1 \rangle + \langle \#2 \rangle$  to contain #3. But since most of the time #3 will be empty we use \let in a tricky way rather than a simple \def since this will save internal memory. We store the argument #3 in a temporary macro \reserved@a.

```
80 \def\reserved@a{#3}%
```

We compare \reserved@a with \empty. If these two are the same we \let the ‘extra’ macro equal to \empty which is not the same as doing a \let to \reserved@a — the latter would blow one extra memory location rather than reusing the one from \empty.

```

81 \global
82 \expandafter\let\csname #1+\#2\expandafter\endcsname
83 \ifx \reserved@a\empty
84 \empty
85 \else \reserved@a
86 \fi
87 }%
88 }

Don't know at the moment what this group here does!
164 \begingroup
We define a macro \reserved@f3 that grabs the next size and loads the corresponding font. This is done by delimiting \reserved@f's only argument by the token , (comma).
165 \def\reserved@f#1,{%
The end of the list will be detected when there are no more elements, i.e. when \reserved@f's argument is empty. The trick used here is explained in Appendix D of the TeXbook: if the argument is empty the \if will select the first clause and \let \reserved@f equal to \relax. (We use the > character here since it cannot appear in font file names.)
166 \if>##1{%
167 \let\reserved@f\relax
168 \else
Otherwise, we define \font@name appropriately and call \pickup@font to do the work. Note that the requested \curr@fontshape combination must have been defined, or you will get an error. The definition of \font@name is carried out globally to be consistent with the rest of the code in this file.
169 \xdef\font@name{\csname#1/#2/#3/#4/#\endcsname}%
170 \pickup@font
Now we forget the name of the font just loaded. More precisely, we set the corresponding control sequence to \relax. This means that later on, when the font is first used, the macro \define@newfont is called again to execute the 'extra' macro for this font.
171 \global\expandafter\let\font@name\relax
172 \fi
Finally we call \reserved@f again to process the next size. If \reserved@f was \let equal to \relax this will end the macro.
173 \reserved@f}%
We finish with reinserting the list of sizes after the \reserved@f macro and appending an empty element so that the end of the list is recognized properly.

## 26 Selecting a new font

### 26.1 Macros for the user

\fontencoding \f@encoding As we said in the introduction a font is described by four parameters. We first define macros to specify the wanted *family*, *series*, or *shape*. These are simply recorded in internal macros \f@family, \f@series, and \f@shape, resp. We use \edef's so that the arguments can also be macros.

```

199 \DeclareRobustCommand\fontencoding[1]{%
200 \expandafter\ifx\csname T@\#1\endcsname\relax
201 \@latex@error{Encoding scheme '#1' unknown}\@eha
202 \else
203 \edef\f@encoding{#1}%
204 \ifx\cf@encoding\f@encoding

```

If the new encoding is the same as the old encoding we have nothing to do. However, in case we had a sequence of several encoding changes without a \selectfont inbetween we can save processing by making sure that \enc@update is \relax.

```

205 \let\enc@update\relax
206 \else

```

If current and new encoding differ we define the macro `\enc@update` to contain all updates necessary at `\selectfont` time.

```
207 \let\enc@update\@enc@update
208 \fi
209 \fi
210 }
```

`\@enc@update`

```
211 \def\@enc@update{%
```

When `\@enc@update` is executed `\f@encoding` holds the encoding name for the new encoding and `\cf@encoding` the name of the last active encoding.

We start by setting the init command for encoding dependent macros to `\@changed@cmd`.

```
212 \expandafter
213 \let
214 \csname\cf@encoding -cmd\endcsname
215 \@changed@cmd
```

Then we turn the one for the new encoding to `\@current@cmd` (see `ltoutenc.dtx` for further explanations).

```
216 \expandafter
217 \let
218 \csname\f@encoding-cmd\endcsname
219 \@current@cmd
```

We execute the default settings `\default@T`, followed by the one for the new encoding.

```
220 \default@T
221 \csname T@\f@encoding\endcsname
```

Finally we change the default substitution values, disable `\enc@update` and make `\f@encoding` officially the current encoding.

```
222 \csname D@\f@encoding\endcsname
223 \let\enc@update\relax
224 \let\cf@encoding\f@encoding
225 }
```

`\enc@update` The default action in `\selectfont` is to do nothing.

```
226 \let\enc@update\relax
```

`\fontfamily`

```
\f@family 227 \DeclareRobustCommand\fontfamily[1]{\edef\f@family{\#1}}
\fontseries 228 \DeclareRobustCommand\fontseries[1]{\edef\f@series{\#1}}
\f@series 229 \DeclareRobustCommand\fontshape [1]{\edef\f@shape{\#1}}
```

`\fontshape` Some handy abbreviation if you want to get some particular font in the current size. If also the size should change one has to issue a `\fontsize` command first.

```
230 \def\usefont#1#2#3#4{\fontencoding{\#1}\fontfamily{\#2}%
231 \fontseries{\#3}\fontshape{\#4}\selectfont
232 \ignorespaces}
```

**\linespread** The command `\linespread` changes the current `\baselinestretch` by calling `\set@fontsize`. The values for `\f@size` and `\f@baselineskip` will be left unchanged.

```
233 \DeclareRobustCommand{\linespread}[1]
234 {\set@fontsize{#1}\f@size\f@baselineskip}
```

**\fontsize** We also define a macro that allows to specify a size. In this case, however, we also need the value of `\baselineskip`. As the first argument to `\set@fontsize` we pass the current value of `\baselinestretch`. This will either match the internal value (in which case nothing changes, or it will be an updated value due to a user change of that macro using `\renewcommand`. If we would pass the internal `\f@linespread` such a change would be efectively overwritten by a size change.

```
235 \DeclareRobustCommand{\fontsize}[2]
236 {\set@fontsize\baselinestretch{#1}{#2}}
```

**\f@linespread** This macro holds the current internal value for `\baselinestretch`.

```
237 \let\f@family\empty
238 \let\f@series\empty
239 \let\f@shape\empty
240 \let\f@size\empty
241 \let\f@baselineskip\empty
242 \let\f@linespread\empty
```

**\cf@encoding**

```
243 \let\f@encoding\empty
244 \let\cf@encoding\empty
```

**\@defaultunits** The function `\@defaultunits` when wrapped around a dimen or skip assignment supplies default units. Usage:

```
\@defaultunits\dimen@=#1pt\relax\@nnil
```

Note: the `\relax` is \*important\*. Other units can be substituted for the ‘pt’ if desired.

We use `\remove@to@nnil` as an auxiliary macros for `\@defaultunits`. It just has to gobble the supplied default unit ‘pt’ or whatever, if it wasn’t used in the assignment.

```
245 \def\@defaultunits{\afterassignment\remove@to@nnil}
```

**\strip@pt** This macro strips the characters pt produced by using `\the` on a dimen register.

```
\rem@pt 246 \begingroup
247 \catcode`P=12
248 \catcode`T=12
249 \lowercase{
250 \def\x{\def\rem@pt##1.##2PT{##1\ifnum##2>\z@\.##2\fi}}
251 \expandafter\endgroup\x
252 \def\strip@pt{\expandafter\rem@pt\the}
```

**\mathversion** `\mathversion` takes the math *version* name as argument, defines `\math@version` appropriately and switches to the font selected forcing a call to `\glb@settings` if the *version* is known to the system.

```
253 \DeclareRobustCommand{\mathversion}[1]
```

```

254 {\@nomath\mathversion
255 \expandafter\ifx\csname mv@\#1\endcsname\relax
256 \@latex@error{Math version '#1' is not defined}\@eha\else
257 \edef\math@version{\#1}\%

```

We need to force a math font setup both now and at the point where we return to the previous math version. Forcing a math font setup can simply be done by setting `\glb@currsize` to an invalid value since this will trigger the setup when the formula starts.

```
258 \gdef\glb@currsize{}%
```

When the scope of the current `\mathversion` ends we need to restore the old setup. However this time we need to force it directly at least if we are inside math, otherwise we could wait. Another way to enhance this code here is to do the setting only if the version really has changed after all. This might be interesting in case of `amstext` and `boldsymbol`.

```

259 \aftergroup\glb@settings
260 \fi}
```

If  $\text{\TeX}$  would support a hook just before the end of a formula (opposite of `\everymath` so to speak) the implementation of the algorithm would be much simpler because in that case we would set up the correct math fonts at this point without having to worry about incorrect settings due to nesting. The same would be true if in  $\text{\LaTeX}$  the use of \$ (as the primitive  $\text{\TeX}$  command) would be impossible and instead only a higher-level interface would be available. Note that this does not mean that a \$ couldn't be the short-hand for starting and stopping that higher-level interface, it only means that the direct  $\text{\TeX}$  function must be hidden.

Anyway, since we don't have this and won't have it in  $\text{\LaTeX} 2\epsilon$  we need to implement it in a somewhat slower way.

We test for the current math font setup on entry of a formula, i.e., on the hooks `\everymath` and `\everydisplay`. But since these hooks may contain user data we provide ourselves with an internal version of these hooks which stays frozen.

|                                   |                                                                                                      |
|-----------------------------------|------------------------------------------------------------------------------------------------------|
| <code>\frozen@everymath</code>    | New internal names for <code>\everymath</code> and <code>\everydisplay</code> .                      |
| <code>\frozen@everydisplay</code> | 261 <code>\let\frozen@everymath\everymath</code>                                                     |
|                                   | 262 <code>\let\frozen@everydisplay\everydisplay</code>                                               |
| <code>\everymath</code>           | Now we provide now user hooks that will be called in the frozen internals.                           |
| <code>\everydisplay</code>        | 263 <code>\newtoks\everymath</code>                                                                  |
|                                   | 264 <code>\newtoks\everydisplay</code>                                                               |
| <code>\frozen@everymath</code>    | Now we define the behaviour of the frozen hooks: first check the math setup then call the user hook. |

|                                   | 266 <code>                  \the\everymath}</code>                                                   |
| <code>\frozen@everydisplay</code> | Ditto for the display hook.                                                                          |
|                                   | 267 <code>\frozen@everydisplay = {\check@mathfonts</code>                                            |
|                                   | 268 <code>                  \the\everydisplay}</code>                                                |
| <code>\curr@math@size</code>      | This holds locally the current math size.                                                            |
|                                   | 269 <code>\let\curr@math@size\empty</code>                                                           |

## 26.2 Macros for loading fonts

- \pickup@font The macro \pickup@font which is used in \selectfont is very simple: if the font name is undefined (i.e. not known yet) it calls \define@newfont to load it.
- ```
270 \def\pickup@font{%
271   \expandafter \ifx \font@name \relax
272     \define@newfont
273   \fi}
```
- \split@name \pickup@font assumes that \font@name is set but it is sometimes called when \f@family, \f@series, \f@shape, or \f@size may have the wrong settings (see, e.g., the definition of \getanddefine@fonts). Therefore we need a macro to extract font *family*, *series*, *shape*, and *size* from the font name. To this end we define \split@name which takes the font name as a list of characters of \catcode 12 (without the backslash at the beginning) delimited by the special control sequence \@nil. This is not very complicated: we first ensure that / has the right \catcode
- ```
274 {\catcode`/=12
and define \split@name so that it will define our private \f@encoding, \f@family,
\f@series, \f@shape, and \f@size macros.
```
- ```
275 \gdef\split@name#1/#2/#3/#4/#5@nil{\def\f@encoding{#1}%
276                               \def\f@family{#2}%
277                               \def\f@series{#3}%
278                               \def\f@shape{#4}%
279                               \def\f@size{#5}}}
```
- \curr@fontshape Abbreviation which may get removed again for speed.
- ```
280 \def\curr@fontshape{\f@encoding/\f@family/\f@series/\f@shape}
281 ⟨/2ekernel | autoload⟩
```
- \define@newfont Now we can tackle the problem of defining a new font.
- ```
282 ⟨/2ekernel | def2 | autoload⟩
283 \def\define@newfont{%
```
- We have already mentioned that the token list that \split@name will get as argument must not start with a backslash. To reach this goal we will set the \escapechar to -1 so that the \string primitive will not generate an escape character. To keep this change local we open a group. We use \begingroup for this purpose since \define@newfont might be called in math mode, and an empty \bgroup...\egroup would add an empty Ord atom to the math list and thus affect the spacing.
- Also locally redefine \typeout so that ‘No file ...fd’ Warnings become Font Info message just sent to the log file.
- ```
284 \begingroup
285 \let\typeout\font@info
286 \escapechar`m@ne
```
- Then we extract *encoding scheme*, *family*, *series*, *shape*, and *size* from the font name. Note the four \expandafter’s so that \font@name is expanded first, then \string, and finally \split@name.
- ```
287   \expandafter\expandafter\expandafter
288     \split@name\expandafter\string\font@name@nil
```

If the `\curr@fontshape` combination is not available, (i.e. undefined) we call the macro `\wrong@fontshape` to take care of this case. Otherwise `\extract@font` will load the external font for us.

```

289 %     \expandafter\ifx
290 %         \csname\curr@fontshape\endcsname \relax
291 %     \try@load@fontshape % try always
292 %     \fi
293 %     \expandafter\ifx
294 %         \csname\curr@fontshape\endcsname \relax
295 %     \wrong@fontshape\else

```

To allow substitution we call the `curr@fontshape` macro which usually will expand to `\relax` but may hold code for substitution (see `\subst@fontshape` definition).

```

296 %     \csname\curr@fontshape\endcsname
297 %     \extract@font\fi

```

We are nearly finished and must only restore the `\escapechar` by closing the group.

```

298 \endgroup
299 </2ekernel | def2 | autoload>

```

As `autofss2.sty` only makes local definitions it is re-loaded for each font, to save some string memory in the kernel, and to speed up the loading of some packages which may load fonts. The code is actually pre-loaded into the kernel and removed at `\begin{document}`. The `\ifx` test below ensures that if `\usepackage{autofss2}` appears in the preamble, then the code is not removed at this time. Can not use `\AtBeginDocument` here as it is not defined yet! Listing all the commands like this is not ideal as any changes to the `autofss2.sty` need to be reflected here, but this seems the most memory efficient mechanism as it avoids the use of an extra `csname` to store the list.

This is currently disabled, so the ‘`autofss2`’ code remains in the kernel, and `autofss2.sty` is not generated in the current public release.

```

325   \do\subf@sfcnt
326   \do\fixed@sfcnt
327   \endgroup
328   \fi}
329 {/autoloadxxx}
330 {*2ekernel | autoload}
331 \def\try@load@fontshape{%
332   \expandafter
333   \ifx\csname \f@encoding+\f@family\endcsname\relax
334     \@font@info{Try loading font information for
335     \f@encoding+\f@family}%

```

We redefine this combination to be `\empty` which means that next time we don't try again unnecessary in case we don't find a `.fd` file. If the file contains a `\DeclareFontFamily` command than this setting will be overwritten.

```

336   \global\expandafter\let
337     \csname\f@encoding+\f@family\endcsname\empty

```

Set the catcodes used in the syntax, but do it only once (this will be restored at the end of the font loading group).

```

338   \nfss@catcodes
339   \let\nfss@catcodes\relax

```

For increased portability make the external filename monocase, but look for the (old style) mixed case filename if the first attempt fails.

On any monocase system this means that the file is looked for twice which takes up time and string space, but at least for this release Check for both names to give people time to re-install their private fd files with lowercase names.

```

340   \edef\reserved@a{%
341     \lowercase{%
342       \noexpand\InputIfFileExists{\f@encoding\f@family.fd}}%
343     \reserved@a\relax
344     {\@input{\f@encoding\f@family.fd}}%
345   \fi}

```

`\nfss@catcodes` This macro should contain the standard `\catcode` assignments to all characters which are used in the commands found in an `.fd` file and which might have special `\catcodes` in the middle of a document. If necessary, this list can be extended in a package file using a suitable number of `\expandafter`, i.e.,

```

\expandafter\def\expandafter\nfss@catcodes
\expandafter{\nfss@catcodes <additional settings>}

```

Note, that this macro might get executed several times since it is also called by `\DeclareFontShape`, thus it probably should not be misused as a general purpose hook.

```

346 \def\nfss@catcodes{%

```

We start by making `\` a letter and ignoring all blanks and newlines.

```

347   \makeatletter
348   \catcode`\ 9%

353      \catcode'{}@tw@  
354      \catcode'#6%  
355      \catcode'^7%  
356      \catcode'%14%
```

The we make sure that the important syntax parts have the right \catcode.

```
357  \@makeother\<%  
358  \@makeother\>%  
359  \@makeother\*%  
360  \@makeother\.%  
361  \@makeother\-%  
362  \@makeother\/%  
363  \@makeother\[%  
364  \@makeother\]%
```

```
365  \@makeother\`%  
366  \@makeother\'%  
367  \@makeother\"%
```

```
368 }
```

\DeclareErrorFont Declare the last resort shape! We assume that in this fontshape there is a 10pt font but it doesn't really matter. We only loose one macro name if the assumption is false. But at least the font should be there!

```
369 \def\DeclareErrorFont#1#2#3#4#5{  
370     \xdef\error@fontshape{  
371         \noexpand\expandafter\noexpand\split@name\noexpand\string  
372         \expandafter\noexpand\csname#1/#2/#3/#4/#5\endcsname  
373         \noexpand\@nil}%"
```

Initialize all those internal variables which may or may not have values in the first seconds of NFSS' bootstrapping process. Later on such values will be updated when an encoding is selected, etc.

We definitely don't want to set \f@encoding; we can set all the others since if they are left "blank" any selection would grab "error default values" as well. However, this probably should go also.

```
374 %      \gdef\f@encoding{#1}%  
375      \gdef\default@family{#2}%  
376      \gdef\default@series{#3}%  
377      \gdef\default@shape{#4}%  
378      \global\let\f@family\default@family  
379      \global\let\f@series\default@series  
380      \global\let\f@shape\default@shape  
381      \gdef\f@size{#5}%  
382      \gdef\f@baselineskip{#5pt}%  
383 }  
384 \onlypreamble\DeclareErrorFont
```

\wrong@fontshape Before we come to the macro \extract@font we have to take care of unknown \curr@fontshape combinations. The general strategy is to issue a warning and to try a default *shape*, then a default *series*, and finally a default *family*. If this

last one also fails T_EX will go into an infinite loop. But if the defaults are set incorrectly one deserves nothing else!

```
385 \def\wrong@fontshape{%
386   \csname D@\f@encoding\endcsname      % install defaults if in math
```

We remember the wanted \curr@fontshape combination which we will need in a moment.

```
387   \edef\reserved@a{\csname\curr@fontshape\endcsname}%
388   \ifx\last@fontshape\reserved@a
```

```
389     \errmessage{Corrupted NFSS tables}%
390     \error@fontshape
391 \else
```

Then we warn the user about the mess and set the shape to its default.

```
392   \let\f@shape\default@shape
```

If the combination is not known, try the default *series*.

```
393   \expandafter\ifx\csname\curr@fontshape\endcsname\relax
394     \let\f@series\default@series
```

If this is still undefined, try the default *family*. Otherwise give up. We never try to change the encoding scheme!

```
395   \expandafter
396     \ifx\csname\curr@fontshape\endcsname\relax
397       \let\f@family\default@family
398     \fi \fi
399 \fi
```

At this point a valid \curr@fontshape combination must have been found. We inform the user about this fact.

The \expandafter\string here stops T_EX adding the space that it usually puts after command names in messages. The similar construction with \undefined just produces ‘undefined’, but saves a few tokens.

\@wrong@font@char is locally redefined in \UseTextSymbol from its normal (empty) definition, to report the symbol generating the font switch.

```
400   \@font@warning{Font shape ‘\expandafter\string\reserved@a’
401                 \expandafter@\gobble\string\undefined\MessageBreak
402                 using ‘\curr@fontshape’ instead\@wrong@font@char}%
403   \global\let\last@fontshape\reserved@a
```

We change \@defaultsubs to produce a warning at the end of the document.

The macro \@defaultsubs is initially \relax but gets changed here if some default font substitution happens. It is then executed in \enddocument.

```
404   \gdef\@defaultsubs{%
405     \@font@warning{Some font shapes were not available, defaults
406                   substituted.\@gobbletwo}}%
```

If we substitute a \curr@fontshape combination by the default one we don’t want the warning to be printed out whenever this (unknown) combination is used. Therefore we globally \let the macro corresponding to the wanted combination equal to its substitution. This requires the use of four \expandafter’s since \csname... \endcsname has to be expanded before \reserved@a (i.e. the requested combination), and this must happen before the \let is executed.

```
407   \global\expandafter\expandafter\expandafter\let
408     \expandafter\reserved@a
409     \csname\curr@fontshape\endcsname
```

Now we can redefine `\font@name` accordingly. This *must* be done globally since it might occur in the group opened by `\define@newfont`. If we would this definition were local the closing `\endgroup` there would restore the old meaning of `\font@name` and then switch to the wrong font at the end of `\selectfont` although the correct font was loaded.

```
410     \xdef\font@name{%
411         \csname\curr@fontshape/\f@size\endcsname}%

```

The last thing this macro does is to call `\pickup@font` again to load the font if it is not defined yet. At this point this code will loop endlessly if the defaults are not well defined.

```
412     \pickup@font}
```

`\@wrong@font@char` Normally empty but redefined in `\UseTextSymbol` so that the Font shape undefined message can refer to the symbol causing the problem.

```
413 \let\@wrong@font@char\empty
```

`\@@defaultsubs` See above.

```
414 \let\@defaultsubs\relax
```

`\strip@prefix` In `\extract@font` we will need a way to recover the replacement text of a macro. This is done by the primitive `\meaning` together with the macro `\strip@prefix` (for the details see appendix D of the T_EXbook, p. 382).

```
415 \def\strip@prefix#1>{}
```

27 Assigning math fonts to *versions*

`\install@mathalphabet` This is just another name for `\gdef` but we can redefine it if necessary later on.

```
416 \let\install@mathalphabet\gdef
```

`\math@fonts`

```
417 \let\math@fonts\empty
```

`\select@group` `\select@group` has four arguments: the new *(math alphabet identifier)* (a control sequence), the *(math group number)*, the extra macro for math mode and the `\curr@fontshape` definition macro name. We first check if we are in math mode.

```
418 %\def\select@group#1#2#3{\relax\ifmmode
```

We do these things locally using `\begingroup` instead of `\bgroup` to avoid the appearance of an empty Ord atom on the math list.

```
419 % \begingroup
```

We set the math fonts for the *family* in question by calling `\getanddefine@fonts` in the correct environment.

```
420 %     \escapechar\m@ne
```

```
421 %     \getanddefine@fonts{\csname c@mv@\math@version\endcsname}#3%
```

We globally select the math fonts...

```
422 %     \globaldefs\one \math@fonts
```

... and close the group to restore `\globaldefs` and `\escapechar`.

```
423 % \endgroup
```

As long as no *size* or *version* change occurs the $\langle\mathit{math alphabet identifier}\rangle$ should simply switch to the installed *math group* instead of calling `\select@group` unnecessarily. So we globally redefine the first argument (the new $\langle\mathit{math alphabet identifier}\rangle$) to expand into a `\mathgroup` switch and then select this *alphabet*. Note that this redefinition will be overwritten by the next call to a *version* macro.

The original code for the end of `\select@group` was

```
\gdef#1{\#3\mathgroup #2}#1\fi}
```

i.e. first redefining the $\langle\mathit{math alphabet identifier}\rangle$ and then calling the new definition to switch to the wanted $\langle\mathit{math group}\rangle$. Now we define the $\langle\mathit{math alphabet identifier}\rangle$ as a call to the `\use@mathgroup` command.

```
424 % \xdef#1{\noexpand\use@mathgroup\noexpand#2%
425 %           {\number\csname c@mv@\math@version\endcsname}}%
```

But this is not sufficient, as we learned the hard way. The problem here is that the loading of the fonts that comprise the alphabet identifier #1, as well as the necessary math font assignments is deferred until it is used. This is OK so far, but if the fonts are switched within the current formula (which may happen if a sub-formula is a box that contains a math version switch) the font assignments for #1 are not restored unless #1 is used again. This is disastrous since TeX sees the wrong fonts at the end of the math formula, when it converts the math list into a horizontal list.

This is taken into account as follows: When a math alphabet identifier is used for the first time in a certain version it modifies the corresponding macro `\mv@<version>` so that it calls `\getanddefine@fonts` directly in future as well. We use the macro `\extract@alph@from@version` to do this. It takes the math alphabet identifier #1 and the math version macro as arguments.

```
426 % \expandafter\extract@alph@from@version
427 %   \csname mv@\math@version\expandafter\endcsname
428 %   \expandafter{\number\csname c@mv@\math@version\endcsname}%
429 %   #1%
430 % \stepcounter{mv@\math@version}%
```

Finally, it is not possible to simply call the new definition since we have an argument (the third argument of `\use@mathgroup` or more exactly the argument of `\math@egroup` if the `margid` option is in force) which would swallow our closing `\fi`. So we use the `\expandafter` technique to remove the `\fi` before the `\use@mathgroup` is expanded.

```
431 %\expandafter #1\fi}
```

`\extract@alph@from@version` We proceed to the definition of the macro `\extract@alph@from@version`. As stated above, it takes a math alphabet identifier and a math version macro (e.g. `\mv@normal`) as its arguments.

```
432 \def\extract@alph@from@version#1#2#3{%
```

To extract and replace the definition of math alphabet identifier #3 in macro #1 we have to recall how this definition looks like: Somewhere in the replacement text of #1 there is the sequence

```
\install@mathalphabet<math alphabet identifier> #3{%
  Definitions for }#3}
```

Hence, the first thing we do is to extract the tokens preceding this definitions, the

definition itself, and the tokens following it. To this end we define one auxiliary macro `\reserved@a`.

```
433     \def\reserved@a##1\install@mathalphabet#3##2##3@nil{%
```

When `\reserved@a` is expanded, it will have the tokens preceding the definition in question in its first argument (`##1`), the following tokens in its third argument (`##3`), and the replacement text for the math alphabet identifier `#3` in its second argument. (`##2`). This is then recorded for later use in a temporary macro `\reserved@b`.

```
434     \def\reserved@b{##2}%
```

Additionally, we define a macro `\reserved@c` to reconstruct the definitions for the math version in question from the tokens that will remain unchanged (`##1` and `##3`) and the yet to build new definitions for the math alphabet identifier `#3`.

```
435     \def\reserved@c####1{\gdef#1{##1####1##3}}%
```

Then we execute our auxiliary macro.

```
436     \expandafter\reserved@a#1@nil
```

OK, so now we have to build the new definition for `#3`. To do so, we first extract the interesting parts out of the old one. The old definition looks like:

```
\select@group<math alphabet identifier>
  <math group number><math extra part>
  <curr@fontshape definition>
```

So we define a new temporary macro `\reserved@a` that extracts these parts.

```
437     \def\reserved@a\select@group#3##1##2@nil{%
```

This macro can now directly rebuild the math version definition by calling `\reserved@c`:

```
438     \reserved@c{%
439       \getanddefine@fonts{#2}##2%
440       \install@mathalphabet#3{%
441         \relax\ifmmode \else \non@alpherr#3\fi
442         \use@mathgroup##1{#2}}}%
```

In addition it defines the alphabet the way it should be used from now on.

```
443     \gdef#3{\relax\ifmmode \else \non@alpherr#3\fi
444       \use@mathgroup##1{#2}}%
```

Finally, we only have to call this macro `\reserved@a` on the old definitions recorded in `\reserved@b`:

```
445     \expandafter\reserved@a\reserved@b@nil
446 }
```

`\math@bgroup` Here are the default definitions for `\math@bgroup` and `\math@egroup`. We use `\bgroup` instead of `\begingroup` to avoid ‘leaking out’ of style changes. This has the side effect of always producing mathord atoms.

```
447 \let\math@bgroup\bgroup
448 \def\math@egroup#1{#1\egroup}
449 </2ekernel | autoload>
```

`\calculate@math@sizes` Here is the default definition for `\calculate@math@sizes` a more elaborate interface is under testing in `mthscale.sty`.

```
450 <*2ekernel | def1>
```

```

451 \gdef\calculate@math@sizes{%
452   \Qfont@info{Calculating\space math\space sizes\space for\space

File p **ltfsstrc.dtx**

28 Introduction

This package contains the code for tracing font loading and font changes. It basically overlays some of the low-level functions of NFSS with additional code used for tracing.

The package accepts the following options:

errorshow Write all information about font changes etc. only to the transcript file unless an error happens. This means that information about font substitution will not be shown on the terminal.

warningshow Show all NFSS warnings on the terminal. This setting corresponds to the default behaviour of NFSS if the **tracefnt** package is *not* loaded!

infoshow Show all NFSS warning and all NFSS info messages (that are normally only written to the transcript file) also on the terminal. This is the default if the **tracefnt** package is loaded.

debugshow In addition to **infoshow** show also changing of math fonts as far as possible (this option can produce a large amount of output).

loading Show the name of external fonts when they are loaded. This option shows only “newly” loaded fonts not those already preloaded in the format or the class file before the **tracefnt** package became active.

pausing Turn all font warnings into errors so that L^AT_EX will stop.

29 A driver for this document

The next bit of code contains the documentation driver file for T_EX, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

When this file is processed directly by L^AT_EX this will produce the documentation as well.

```
1 <*driver>
2 \documentclass{ltxdoc}
3
4
5 %\OnlyDescription % comment out for implementation details
6
7 \begin{document}
8   \DocInput{ltfsstrc.dtx}
9 \end{document}
10 </driver>
```

30 The Implementation

Warning: Read the macro documentation with a grain of salt. It is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

If we are making a package file it is a good idea to test whether we are running under 2e. This code is actually placed at the very beginning of this file for easier maintenance, thus commented out here.

```
11 <*package>
12 %\NeedsTeXFormat{LaTeX2e}
13 %\ProvidesPackage{tracefnt}[??/??/?? v?.??
14 %                                Standard LaTeX package (font tracing)]
15 </package>
```

The debug module makes use of commands contained in a special package file named `trace.sty`.⁴

```
16 <+debug> \input trace.sty
```

31 Handling Options

\tracingfonts Here is the definition of the integer register for the font trace. As a default in a package file we use 1 to give error messages if fonts are substituted. If this code is used for debugging or tracing reasons in the format file (i.e. in `fam.dtx`) we use 0 as the default. But if no font trace is used we build a definition that will produce a warning message.

```
17 <*2ekernel | autoload>
18 \def\tracingfonts{%
19   \iffont@warning{Command \noexpand\tracingfonts
20     not provided.\MessageBreak
21     Use the 'tracefnt' package.\MessageBreak Command found:}%
22   \count@}
23 </2ekernel | autoload>
```

The `\count@` in the line above will remove the number after `\tracingfonts`. Note that this definition will be overwritten by the next line if one of these modules are included.

```
24 <*package,trace,debug>
25 \newcount\tracingfonts
26 \tracingfonts=0
27 </package,trace,debug>
```

The option `errorshow` turns off all warnings so that only real errors are shown. `warningshow` corresponds to the NFSS default (when `tracefnt` is not loaded). `infoshow` is the default for this package here; and `debugshow`, `loading`, and `pausing` extend the amount of information even further.

```
28 <*package>
29 \DeclareOption{errorshow}{%
30   \def\@font@info#1{%
```

⁴This package is not in distribution at the moment (and probably doesn't work any longer). Think of this part of the code as being historical artefacts.

```

31          \GenericInfo{(Font)}{\@spaces\@spaces\@spaces\space\space}%
32          {LaTeX Font Info: \space\space\space#1}%%
33 \def\@font@warning#1{%
34     \GenericInfo{(Font)}{\@spaces\@spaces\@spaces\space\space}%
35     {LaTeX Font Warning: #1}%%
36 }
37 \DeclareOption{warningshow}{%
38   \def\@font@info#1{%
39       \GenericInfo{(Font)}{\@spaces\@spaces\@spaces\space\space}%
40       {LaTeX Font Info: \space\space\space#1}%%
41   \def\@font@warning#1{%
42       \GenericWarning{(Font)}{\@spaces\@spaces\@spaces\space\space}%
43       {LaTeX Font Warning: #1}%%
44   }
45 \DeclareOption{infoshow}{%
46   \def\@font@info#1{%
47       \GenericWarning{(Font)}{\@spaces\@spaces\@spaces\space\space}%
48       {LaTeX Font Info: \space\space\space#1}%%
49   \def\@font@warning#1{%
50       \GenericWarning{(Font)}{\@spaces\@spaces\@spaces\space\space}%
51       {LaTeX Font Warning: #1}%%
52   }
53 \DeclareOption{loading}{%
54   \tracingfonts\tw@
55 }
56 \DeclareOption{debugshow}{%
57   \ExecuteOptions{infoshow}%
58   \tracingfonts\thr@@
59 }
60 \DeclareOption{pausing}{%
61   \def\@font@warning#1{%
62     \GenericError
63     {(Font)}{\@spaces\@spaces\@spaces\space\space}%
64     {LaTeX Font Warning: #1}%%
65     {See the LaTeX Companion for details.}%%
66     {I'll stop for every LaTeX Font Warning because
67      you requested\MessageBreak the 'pausing' option
68      to the tracefnt package.}%%
69   }

```

We make `infoshow` the default, which in turn defines `\font@warning` and `\font@info`.

```

70 \ExecuteOptions{infoshow}
71 \ProcessOptions
72 
```

We also need a default definition inside the kernel:

```

73 (*2ekernel | autoload)
74 \def\@font@info#1{%
75     \GenericInfo{(Font)}{\@spaces\@spaces\@spaces\space\space}%
76     {LaTeX Font Info: \space\space\space#1}%%
77 \def\@font@warning#1{%

```

```

78          \GenericWarning{(Font)\@spaces\@spaces\@spaces\space\space}%
79          {LaTeX Font Warning: #1}%
80 </2ekernel | autoload>

```

32 Macros common to fam.tex and tracefnt.sty

In the first versions of `tracefnt.dtx` some macros of `fam.dtx`⁵ were redefined to include the extra tracing information. Now these macros are all defined in this file (i.e. removed from `fam.dtx`) and different production versions can be obtained simply by specifying a different set of modules to include when generating `ltfss.dtx`.

32.1 General font loading

`\extract@font` This macro organizes the font loading. It first calls `\get@external@font` which will return in `\external@font` the name of the external font file (the `.tfm`) as it was determined by the NFSS tables.

```

81 <*2ekernel | package | autoload>
82 \def\extract@font{%
83   \get@external@font

```

Then the external font is loaded and assigned to the font identifier stored inside `\font@name` (for this reason we need `\expandafter`).

```
84   \global\expandafter\font\font@name\external@font\relax
```

When tracing we typeout the internal and external font name.

```

85 <*trace>
86   \ifnum \tracingfonts >\@ne
87     \font@info{External font '\external@font'
88       loaded as\MessageBreak \font@name}\fi
89 </trace>

```

Finally we call the corresponding “loading action” macros to finish things. First the font is locally selected to allow the use of `\font` inside the loading action macros.

```
90   \font@name \relax
```

The next two lines execute the “loading actions” for the family and then for the individual font shape.

```

91   \csname \f@encoding+\f@family\endcsname
92   \csname\curr@fontshape\endcsname
93   \relax
94 }
95 </2ekernel | package | autoload>

```

The `\relax` at the end needs to be explained. This is inserted to prevent `TEX` from scanning too far when it is executing the replacement text of the loading code macros.

`\get@external@font` This function tries to find an external font name. It will place the name into the macro `\external@font`. If no font is found it will return the one that was defined via `\DeclareErrorFont`.

⁵This file is currently not distributed in documented form. Its code is part of `ltfss.dtx`.

```

96 <*2ekernel | autoload>
97 \def\get@external@font{%

```

We don't know the external font name at the beginning.

```

98   \let\external@font@\empty
99   \edef\font@info{\expandafter\expandafter\expandafter\string
100     \csname \curr@fontshape \endcsname}%
101   \try@size@range

```

If this failed, we'll try to substitute another size of the same font. This is done by the `\try@size@substitution` macro. It "knows about" `\do@extract@font`, `\font@name`, `\f@size`, and so on.

```

102   \ifx\external@font@\empty
103     \try@size@substitution
104     \ifx\external@font@\empty
105       \@latex@error{Font \expandafter \string\font@name\space
106                     not found}\@eha
107       \error@fontshape
108       \get@external@font
109     \fi\fi
110   }
111 </2ekernel | autoload>

```

`\selectfont` The macro `\selectfont` is called whenever a font change must take place.

```

112 <*2ekernel | package | autoload>
113 \DeclareRobustCommand\selectfont
114   {%

```

When `debug` is specified we actually want something like 'undebbug'. The font selection is now stable so that using `\tracingall` on some other macros will show us a lot of unwanted information about font loading. Therefore we disable tracing during font loading as long as `\tracingfonts` is less than 4.

```

115 <+debug>  \pushtracing
116 <+debug>  \ifnum\tracingfonts<4 \tracingoff
117 <+debug>  \else \tracingon\p@selectfont \fi

```

If `\baselinestretch` was redefined by the user it will not longer match its internal counterpart `\f@linespread`. If so we call `\set@fontsize` to prepare `\size@update`.

```

118   \ifx\f@linespread\baselinestretch \else
119     \set@fontsize\baselinestretch\f@size\f@baselineskip \fi

```

Then we generate the internal name of the font by concatenating *family*, *series*, *shape*, and current *size*, with slashes as delimiters between them. This is much more readable than standard L^AT_EX's `\twfbf`, etc. We define `\font@name` globally, as always. The reason for this is explained later on.

```

120   \xdef\font@name{%
121     \csname\curr@fontshape/\f@size\endcsname}%

```

We call the macro `\pickup@font` which will load the font if necessary.

```

122   \pickup@font

```

Then we select the font.

```

123   \font@name

```

If `\tracingfonts` is greater than 2 we also show the font switch. We do this before `\glb@settings` is called since this macro might redefine `\font@name`.

```
124 <*trace>
125     \ifnum \tracingfonts>\tw@
126         \@font@info{Switching to \font@name}\fi
127 </trace>
```

Finally we call `\size@update`. This macro is normally empty but will contain actions (like setting the `\baselineskip`) that have to be carried out when the font size, the base `\baselineskip` or the `\baselinestretch` have changed.

```
128     \size@update
```

A similar function is called to handle anything related to encoding updates. This one is changed from `\relax` by `\fontencoding`.

```
129     \enc@update
```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```
130 <+debug> \poptracing
131 }
```

`\set@fontsize` The macro `\set@fontsize` does the actual work. First it assigns new values to `\f@size`, `\f@baselineskip` and `\f@linespread`.

```
132 \def\set@fontsize#1#2#3{%
133     \@defaultunits\@tempdimb#2pt\relax\@nnil
134     \edef\f@size{\strip@pt\@tempdimb}%
135     \@defaultunits\@tempskipa#3pt\relax\@nnil
136     \edef\f@baselineskip{\the\@tempskipa}%
137     \edef\f@linespread{#1}%
138 }
```

For backward compatibility and for later testing within `\selectfont` the internal value of `\f@linespread` is passed back to `\baselinestretch`.

```
138     \let\baselinestretch\f@linespread
```

Additional processing will happen within `\selectfont`. For this reason the macro `\size@update` (which will be called in `\selectfont`) will be defined to be:

```
139     \def\size@update{%
```

First calculate the new `\baselineskip` and also store it in `normalbaselineskip`

```
140     \baselineskip\f@baselineskip\relax
141     \baselineskip\f@linespread\baselineskip
142     \normalbaselineskip\baselineskip
```

then to set up a new `\strutbox`

```
143     \setbox\strutbox\hbox{%
144         \vrule\@height.7\baselineskip
145             \@depth.3\baselineskip
146             \@width\z@}%
147 }
```

We end with a bit of tracing information.

```
147 <*trace>
148     \ifnum \tracingfonts>\tw@
149         \ifx\f@linespread\empty
150             \let\reserved@a\empty
151         \else
152             \def\reserved@a{\f@linespread x}%
153 }
```

```

153      \fi
154      \font@info{Changing size to \f@size/\reserved@a
155          \f@baselineskip}%
156      \aftergroup\type@restoreinfo \fi
157 
```

When all this is processed `\size@update` redefines itself to `\relax` so that in later calls of `\selectfont` no extra code will be executed.

```

158      \let\size@update\relax}%
159 }

```

Instead of defining this macro internally we might speed things up by placing the code into a separate macro and use `\let!`

`\size@update` Normally this macro does nothing; it will be redefined by `\set@fontsize` to initiate an update.

```
160 \let\size@update\relax
```

`\type@restoreinfo` This macro produces some info when a font size and/or baseline change will get restored.

```

161 (*trace)
162     \def\type@restoreinfo{%
163         \ifx\f@linespread\empty
164             \let\reserved@a\empty
165         \else
166             \def\reserved@a{\f@linespread x}%
167         \fi
168         \font@info{Restoring size to
169             \f@size/\reserved@a\f@baselineskip}%
170 
```

`\glb@settings` The macro `\glb@settings` globally selects all math fonts for the current size if necessary.

```
171 \def\glb@settings{%
```

When `\glb@settings` gains control a size change was requested and all previous font assignments need to be replaced. Therefore the old values of the fonts are no longer needed. For every *math group* the new assignments are appended to `\math@fonts`. But this happens only if the `math@fonts` switch is set to true. However, we always set up the correct math sizes for script and scriptscript fonts since they may be needed even if we don't set up the whole math machinery.

Here we set the math size, script size and scriptscript size. If the `S@...` macro is not defined we have to first calculate the three sizes.

```

172     \expandafter\ifx\csname S@\f@size\endcsname\relax
173         \calculate@math@sizes
174     \fi

```

The effect of this is that `\calculate@math@sizes` may or may not define the `S@...` macro. In the first case the next time the same size is requested this macro is used, otherwise `\calculate@math@sizes` is called again. This also sets the `math@fonts` switch. If it is true we must switch the math fonts.

```

175     \csname S@\f@size\endcsname
176     \ifmath@fonts
177 
```

```

178      \ifnum \tracingfonts>\tw@
179          \@font@info{Setting up math fonts for
180              \f@size/\f@baselineskip}\fi
181 
```

Inside a group we execute the macro for the current math *version*. This sets `\math@fonts` to a list of `\textfont...` assignments. `\getanddefine@fonts` (which may be called at this point) needs the `\escapechar` parameter to be set to `-1`.

```

182      \begingroup
183          \escapechar\m@ne
184          \csname mv@\math@version \endcsname

```

Then we set `\globaldefs` to 1 so that all following changes are done globally. The math font assignments recorded in `\math@fonts` are executed and `\glb@currsize` is set equal to `\f@size`. This signals that the fonts for math in this size are set up.

```

185      \globaldefs\@ne
186      \math@fonts
187      \let \glb@currsize \f@size
188 
```

Finally we execute any code that is supposed to happen whenever the math font setup changes. This register will be executed in local mode which means that everything that is supposed to have any effect should be done globally inside. We can't execute it within `\globaldefs\@ne` as we don't know what ends up inside this register, e.g., it might contain calculations which use some local registers to calculate the final (global) value.

```
189      \the\every@math@size
```

Otherwise we announce that the math fonts are not set up for this size.

```

190 <*trace>
191     \else
192         \ifnum \tracingfonts>\tw@
193             \@font@info{No math setup for
194                 \f@size/\f@baselineskip}\fi
195 
```

```

196     \fi
197 }
198 
```

`\baselinestretch` In `\selectfont` we used `\baselinestretch` as a factor when assigning a value to `\baselineskip`. We use 1 as a default (i.e. no stretch).

```

199 <*2ekernel | autoload>
200 \def\baselinestretch{1}

```

`\every@math@size` We must still define the hook `\every@math@size` we used in `\glb@settings`. We initialize it to nothing. It is important to remember that everything that goes into this hook should to global updates, local changes will have weird effects.

```

201 \newtoks\every@math@size
202 \every@math@size={}
203 
```

32.2 Math fonts setup

32.2.1 Outline of algorithm for math font sizes

\TeX uses the the math fonts that are current when the end of a formula is reached. If we don't want to keep font setups local to every formula (which would result in an enormous overhead, we have to be careful not to end up with the wrong setup in case formulas are nested, e.g., we need to be able to handle

```
$ a=b+c \mbox{ \small for all $b$ and $c\in Z$}$
```

Here the inner formulae b and $c \in Z$ are typeset in \small but we have to return to \normalsize before we reach the closing $$$ of the outer formula.

This is handled in the following way:

1. At any point in the document the global variable \gbl@currsize contains the point size for which the math fonts currently are set up.
2. Whenever we start a formula we compare its value with the local variable \f@size that describes the current text font size.
3. If both are the same we assume that we can use the current math font setup without adjustment.
4. If they differ we call \gbl@settings which changes the math font setup and updates \gbl@currsize .
 - (a) If we are recursively inside another formula (\if@inmath) we ensure that \gbl@settings is executed again in the outer formula, so that the old setup is automatically restored.
 - (b) Otherwise, we set the switch \@inmath locally to true so that all nested formulae will be able to detect that they are nested in some outer formula.

The above algorithm has the following features:

- For sizes which are not containing any formula no math setup is done. Compared to the original algorithm of NFSS this results in the following savings:
 - No unnecessary loading of math fonts for sizes that are not used to typeset any math formulae (explicit or implicit ones).
 - No time overhead due to unnecessary changes of the math font setup on entrance and exit of the text font size.
- Math font setup changes for top-level formulae will survive (there is no restoration after the formula) thus any following formula in the same size will be directly typesettable. Compared to original implementation in NFSS2 the new algorithm has the overhead of one test per formula to see if the current math setup is valid (in the original algorithm the setup was always valid, thus no test was necessary).
- In nested formulae the math font setup is restored in the outer formula by a series of \aftergroup commands and checks. Compared to the original algorithm this involves additional checks ($2 \times \langle \text{non-math levels} \rangle$ per inner formula).

32.2.2 Code for math font size setting

`\check@mathfonts` In the `\check@mathfonts` macros we implement the steps 2 to 4 except that instead of a switch the macro `\init@restore@glb@settings` is used.

```

204 <*2ekernel | package | autoload>
205 \def\check@mathfonts{%
206   \ifx \glb@currsize \f@size
207   <*trace>
208     \ifnum \tracingfonts>\thr@@
209       \font@info{*** MATH: no change \f@size\space
210         curr/global (\curr@math@size/\glb@currsizes)\fi
211   </trace>
212   \else
213   <*trace>
214     \ifnum \tracingfonts>\thr@@
215       \font@info{*** MATH: setting up \f@size\space
216         curr/global (\curr@math@size/\glb@currsizes)\fi
217   </trace>
218   \glb@settings
219   \init@restore@glb@settings
220   \fi
221   \let\curr@math@size\f@size
222   \def\init@restore@glb@settings{\aftergroup\restglb@settings}%
223 }
```

`\init@restore@glb@settings` This macro does by default nothing but get redefined inside `\check@mathfonts` to initiate fontsize restoring in nested formulas.

```

224 <-trace> \let\init@restore@glb@settings\relax
225 <*trace>
226 \def\init@restore@glb@settings{%
227   \ifnum \tracingfonts>\thr@@
228     \font@info{*** MATH: no resetting (not in
229       nested math)}\fi
230 }
231 </trace>
```

`\restglb@settings` This macro will be executed the first time after the current formula.

```

232 \def\restglb@settings{%
233 <*trace>
234   \ifnum \tracingfonts>\thr@@
235     \font@info{*** MATH: restoring}\fi
236 </trace>
237   \begingroup
238     \let\f@size\curr@math@size
239     \ifx\glb@currsizes \f@size
240   <*trace>
241     \ifnum \tracingfonts>\thr@@
242       \font@info{*** MATH: ... already okay (\f@size)}\fi
243   </trace>
244   \else
245   <*trace>
246     \ifnum \tracingfonts>\thr@@
247       \font@info{*** MATH: ... to \f@size}\fi
248   </trace>
```

```

249      \glb@settings
250      \fi
251      \endgroup
252 }

```

32.2.3 Other code for math

- \use@mathgroup The \use@mathgroup macro should be used in user macros to select a math group. Depending on whether or not the `margid` option is in force it has two or three arguments. For this reason it should be called as the last macro.

First we test if we are inside math mode since we don't want to apply a useless definition.

```

253 \def\use@mathgroup#1#2{\relax\ifmmode
254 (*trace)
255   \ifnum \tracingfonts>\tw@
256     \count@#2\relax
257     \font@info{Using \noexpand\mathgroup
258       (\the\count@) #2}\fi
259 
```

If so we first call the '=' macro (i.e. argument three) to set up special things for the selected math group. Then we call \mathgroup to select the group given by argument two and finally we place #1 (i.e. the argument of the *math alphabet identifier*) at the end. This part of the code is surrounded by two commands which behave like \begingroup and \endgroup if we want *math alphabet identifier*s but will expand into \empty if we want simply switches to a new math group. Since argument number 2 may be a digit instead of a control sequence we add a \relax. Otherwise something like \mit{1} would switch to math group 11 (and back) instead of printing an oldstyle 1.

```

260   \math@bgroup
261     \expandafter\ifx\csname M@\f@encoding\endcsname#1\else
262       #1\fi
263     \mathgroup#2\relax

```

Before we reinsert the swallowed token (arg. three) into the input stream, in the case that the *math alphabet identifier* isn't called in math mode, we remove the \fi with the \expandafter trick. This is necessary if the token is actually an macro with arguments. In such a case the \fi will be misinterpreted as the first argument which would be disastrous.

```
264   \expandafter\math@egroup\fi}%

```

The surrounding macros equal \begingroup and \endgroup. But using internal names makes it possible to overwrite their meaning in certain cases. This is for example used in *AMS-T_EX* macros for placing accents.

- \math@egroup If the `margid` option is in force (which can be tested by looking at the definition of \math@bgroup we change the \math@egroup command a bit to display the current *math group number* after it closes the scope of *math alphabet* with \endgroup.

```

265 (*trace)
266   \ifx\math@bgroup\bgroup
267     \def\math@egroup#1{\#1\egroup

```

```

268      \ifnum \tracingfonts>\tw@
269      @font@info{Restoring \noexpand\mathgroup
270          (\ifnum\mathgroup=\m@ne default\else \the\mathgroup \fi)%
271          }\fi}
272      \fi
273 
```

\getanddefine@fonts \getanddefine@fonts has two arguments: the *math group number* and the *family/series/shape* name as a control sequence.

```
274 \def\getanddefine@fonts#1#2{%
```

First we turn of tracing when \tracingfonts is less than 4.

```

275 <+debug> \pushtracing
276 <+debug> \ifnum\tracingfonts<4 \tracingoff
277 <+debug> \else \tracingon\getanddefine@fonts \fi

278 (*trace)
279   \ifnum \tracingfonts>\tw@
280   \count@#1\relax
281     @font@info{\noexpand\mathgroup (\the\count@) #1 :=\MessageBreak
282                 \string#2 \tf@size/\sf@size/\ssf@size}\fi
283 
```

We append the current \tf@size to #2 to obtain the font name.⁶ Again, font@name is defined globally, for the reasons explained in the description of \wrong@fontshape.

```
284 \xdef\font@name{\csname \string#2/\tf@size\endcsname}%

```

Then we call \pickup@font to load it if necessary. We remember the internal name as \textfont@name.

```
285 \pickup@font \let\textfont@name\font@name
```

Same game for \scriptfont and \scripts@criptfont:

```

286 \xdef\font@name{\csname \string#2/\sf@size\endcsname}%
287 \pickup@font \let\scriptfont@name\font@name
288 \xdef\font@name{\csname \string#2/\ssf@size\endcsname}%
289 \pickup@font

```

Then we append the new \textfont... assignments to the \math@fonts.

```

290 \edef\math@fonts{\math@fonts
291             \textfont#1\textfont@name
292             \scriptfont#1\scriptfont@name
293             \scripts@criptfont#1\font@name}%

```

Just before ending this macro we have to pop the tracing stack if it was pushed before.

```

294 <+debug> \poptracing
295 }
296 
```

⁶One might ask why this expansion does not generate a macro name that starts with an additional \ character. The solution is that \escapechar is set to -1 before \getanddefine@fonts is called.

33 Scaled font extraction

`\ifnot@nil` We begin with a simple auxiliary macro. It checks whether its argument is the token `\@nil`. If so, it expands to `\@gobble` which discards the following argument, otherwise it expands to `\@firstofone` which reproduces it argument.

```
297 {*2ekernel | autoload}
298 \def\ifnot@nil#1{\def\reserved@a{#1}%
299   \ifx\reserved@a\@nil \expandafter\@gobble
300   \else \expandafter\@firstofone\fi}
```

`\remove@to@nnil` Three other auxiliary macros will be needed in the following: `\remove@to@nnil` gobbles up everything up to, and including, the next `\@nnil` token, and `\remove@angles` and `\remove@star` do the same for the character `>` and `*`, respectively, instead of `\@nil`.

```
301 \def\remove@to@nnil#1\@nil{%
302 \def\remove@angles#1>{\set@simple@size@args}
303 \def\remove@star#1*{#1}
304 </2ekernel | autoload>
```

`\extract@sizefn` This macro takes a size specification and parses it into size function and the optional and mandatory arguments.

```
305 {*2ekernel | def2 | autoload}
306 \def\extract@sizefn#1*#2\@nil{%
307   \if>#2>\set@size@funct@args#1\@nil
308     \let\sizefn@info\empty
309   \else\expandafter\set@size@funct@args\remove@star#2\@nil
310     \def\sizefn@info{#1}\fi
311 }
```

`\try@simple@size` This function tries to extract the given size (specified by `\f@size`) for the requested font shape. The font information must already be present in `\font@info`. The central macro that does the real work is `\extract@fontinfo`. We will first give a simple example how this macro works, and describe it in full generality later.

Assume that the requested parameters are: *encoding scheme* ‘OT1’, *family* ‘cm’, *series* ‘sansserif’, *shape* ‘normal’, and *size* ‘12’. The correspondign font definitions have already been extracted from the macro `\OT1/cm/sansserif/normal` and stored in `\font@info`. (Otherwise `\extract@fontinfo` doesn’t get called.) This information consists of a token list made of characters of category code 12 of the form

```
<10*>cmss10<12*>cmss12<17*>cmss17
```

For reasonable packages one usually needs more sizes but this is sufficient to get the flavour. We will define a macro `\extract@fontinfo` to find the external font name (‘cmss12’) for us:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nil{%
  \set@simple@size@args#3<#4\@nil
  \execute@size@function{#2}}
```

so that when it gets called via

```
\extract@fontinfo<10*>cmss10<12*>cmss12<17*>cmss17\@nil
```

#1 will contain all characters before `<12*>`, #2 will be empty, #3 will be exactly `cmss12`, and #3 will be `17>cmss17`. The expansion is therefore

```
\set@simple@size@args cmss12<17*>cmss17\@nnil
\execute@size@function{}
```

This means: the default (empty) size function will be executed, with its optional argument argument set to empty and its mandatory argument set to `cmss12` by `\set@simple@size@args`. As we discussed earlier, the effect of the default size function is to load the given external font (`cmss12`) at the specified size (12)—which is exactly what was intended.

But this is only part of the whole story. It may be that the size requested does not occur in the token list `\font@info`. And the simple definition of `\extract@fontinfo` we gave above does not allow to specify give more than one size specification in front of the external font name.

Let's address these two problems separately. The first one is solved with the following trick: We define `\extract@fontinfo` as follows:

```
\def\extract@fontinfo#1<12*#2>#3<#4\@nnil{%
\ifnot@nil{#3}{%
{\set@simple@size@args#3<#4\@nnil
\execute@size@function{#2}}%
}}%
```

How does this work? We call `\extract@fontinfo` via

```
\expandafter\extract@fontinfo\font@info<12*>\@nil<\@nnil
```

i.e. by appending `<12*>\@nil<\@nnil`. If the size ('12' in this case) appears in `\font@info` everything works as explained above, the only difference being that argument #4 of `\extract@fontinfo` additionally gets the tokens `<12*>\@nil<\@nnil`. However, if the size is not found everything up to the final `<12*>` is in argument #1, #3 gets `\@nil`, and #2 and #4 are empty. The macro `\ifnot@nil` will discard the calls to `\set@simple@size@args` and `\execute@size@function`, and hence `\font@info` will continue to be equal to `\@empty`. This means that no simple size specification matching the requested size could be found.

The second problem (more than one simple size specification for one external font name) will be addressed in `\set@simple@size@args` below.

The macros are hidden inside other control sequences so that we have to build `\extract@fontinfo` in several steps.

So here's the actual definition of `\extract@font` in `\try@simple@size`.

```
312 % % this could be replaced by \try@size@range making the subst slower!
313 \def\try@simple@size{%
```

`\reserved@a` is made an abbreviation for the head of the definition of the macro `\extract@fontinfo`.

```
314 \def\reserved@a{\def\extract@fontinfo####1}{%
```

Now we can define `\extract@fontinfo`. Here we handle a small but convenient variation: in case of the default (empty) size function it is allowed to omit the `*` character.

```
315 \expandafter\reserved@a\expandafter<\f@size>##2<##3\@nil{%
316 \ifnot@nil{##2}{%
```

```

317      {\set@simple@size@args##2<##3\@nnil
318          \execute@size@function\sizefn@info
319      }%

```

Now we call `\extract@fontinfo`. Note the `<\@nil` tokens at the end.

```

320      \expandafter\expandafter
321      \expandafter\extract@fontinfo\expandafter\font@info
322      \expandafter<\f@size>\@nil<\@nnil
323 }

```

`\set@simple@size@args` As promised above, the macro `\set@simple@size@args` will handle the case of several size specifications in a row. If another size specification follows, the very first token of its argument list is the character `<`. By starting the definition as follows,

```

324 \def\set@simple@size@args#1<{%
parameter #1 is empty in this case, and contains the size function's arguments otherwise. We distinguish these two cases (Note that the character < cannot appear in #1) by calling \remove@angles for empty #1 and \extract@sizefn otherwise. In the latter case we have to take care of the remaining character tokens and discard them. This is done by \remove@to@nnil. Note also the use of Kabelschacht's method.
325     \if<#1<%
326         \expandafter\remove@angles
327     \else
328         \extract@sizefn#1*\@nil
329         \expandafter\remove@to@nnil
330     \fi}

```

Now, we are through with the case of a simple size, except for calling the size function. This will be handled later, as it is the same mechanism for all types of size specification. We will now proceed to macros for extraction of size range specification.

`\extract@rangefontinfo` `\extract@rangefontinfo` goes through a font shape definition in the input until it recognizes the tokens `<\@nil->`. It looks for font ranges with font size functions. Its operation is rather simple: it discards everything up to the next size specification and passes this on to `\is@range` for inspection. The specification (parameter #2 is inserted again, in case it is needed later).

```

331 \def\extract@rangefontinfo#1<#2>{%
332     \is@range#2->\@nil#2>}

```

`\is@range` `\is@range` is again a sort of dispatcher macro: if the size specification it is looking at is not a range specification it discards it and calls `\extract@rangefontinfo` to continue the search. Otherwise it calls `\check@range` to check the requested size against the specified range.

From the way `\is@range` is called inside `\extract@rangefontinfo` we see that #2 is the character `>` if the size specification found is a simple one (as it does not contain a `-` character). This is checked easily enough and `\extract@rangefontinfo` called again. Note that the extra tokens inserted after the `\@nil` in the call to `\is@range` appear at the beginning of the first argument to `\extract@rangefontinfo` and are hence ignored.

```

333 \def\is@range#1-#2\@nil{%
334   \if>#2\expandafter\check@single\else
335     \expandafter\check@range\fi}

\check@range \check@range takes lower bound as parameter #1, upper bound as #2, size function as #3 and the size function's arguments as #4. If #3 is the special token \@nil \font@info is exhausted and we can stop searching.
336 \def\check@range#1-#2>#3<#4\@nil{%
337   \ifnot@nil{#3}{%
If #3 wasn't \@nil we have a range. We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.
338   \def\reserved@f{\extract@rangefontinfo<#4\@nil}%

We have to make sure that both boundaries are present, if not we have to set them. Here we check the upper bound. If \upper@bound is zero after the assignment we set it to \maxdimen (upper open range). We need to use a (dimen) register for the scan since we may have a decimal number as the boundary.
339   \upper@bound0#2\p@
340   \ifdim\upper@bound=\z@ \upper@bound\maxdimen\fi

Now we check the upper boundary against \f@size. If it is larger or equal than \f@size this range is no good and we have to recurse.
341   \ifdim \f@size \p@<\upper@bound

Otherwise we have to check the lower bound. This time it is not necessary to scan the boundary value into a register because if it is empty we get zero as desired. We could even omit the 0 which would result in 1pt as default lower boundary. If \f@size is smaller than the boundary we have to recurse.
342   \lower@bound0#1\p@
343   \ifdim \f@size \p@<\lower@bound
344     \else

If both tests are passed we can try executing the size function.
345   \set@simple@size@args#3<#4\@nil
346   \execute@size@function\sizefn@info

If the function was successful it should have left an external font name in \external@font. We use this to see if we can stop scanning. Otherwise we recurse.
347   \ifx\external@font\@empty
348     \else
349       \let\reserved@f\@empty
350     \fi
351   \fi
352   \fi
353   \reserved@f}
354 /2ekernel | def2 | autoload

\lower@bound We use two dimen registers \lower@bound and \upper@bound to store the lower and upper endpoints of the range we found.
\upper@bound
355 (*2ekernel | autoload)
356 \newdimen\lower@bound
357 \newdimen\upper@bound
358 /2ekernel | autoload)

```

\check@single \check@single takes the size as parameter #1, size function as #2 and the size function's arguments as #3. We can assume that there is always something in the pipeline since the very last entry is a faked range (see above).

```
359 {*2ekernel | def2 | autoload}
360 \def\check@single#1>#2<#3\@nnil{%
```

We start by assuming that we have to recurse. Note that we have to reinsert an < as it was already removed by scanning.

```
361     \def\reserved@f{\extract@rangefontinfo<#3\@nnil}{%
```

Now we check the the size against \f@size. If it is not equal \f@size it is no good and we have to recurse.

```
362     \ifdim \f@size \p@=#1\p@
```

Otherwise if this test is passed we can try executing the size function.

```
363     \set@simple@size@args#2<#3\@nnil
364         \execute@size@function\sizefn@info
```

If the function was successful it should have left an external font name in \external@font. We use this to see if we can stop scanning. Otherwise we recurse.

```
365     \ifx\external@font\@empty
366     \else
367         \let\reserved@f\@empty
368         \fi
369     \fi
370     \reserved@f{}
```

\set@size@funct@args This macro sets the optional and mandatory arguments for a size function. If the optional argument is not present it is set to the empty token list. The mandatory argument is delimited by the token \@nil.

```
371 \def\set@size@funct@args{\@ifnextchar[%]
372   \set@size@funct@args@{\set@size@funct@args@[]}}
373 \def\set@size@funct@args@[#1]#2\@nil{%
374   \def\mandatory@arg{#2}%
375   \def\optional@arg{#1}%
376 }/2ekernel | def2 | autoload)
```

\DeclareSizeFunction This function defines a new size function hiding the internal from the designer. The body of the size function may use \optional@arg and \mandatory@arg denoting the optional and mandatory argument that may follow the size specification <...>.

```
377 {*2ekernel | autoload}
378 \def\DeclareSizeFunction#1#2{\@namedef{s@fct@#1}{#2}}
379 \onlypreamble\DeclareSizeFunction
380 }/2ekernel | autoload)
```

\execute@size@function This macro is very simple. The only point worth noting is that calling an undefined size function will do nothing (actually execute a \relax).

```
381 {*2ekernel | package | autoload}
382 \def\execute@size@function#1{%
383   %% could be added to autoload as well
384   \ifundefined{s@fct@#1}{%
```

```

385      {\errmessage{Undefined font size function #1}%
386      \s@fct@}%
387      {\csname s@fct@#1\endcsname}%
388 {/trace}%
389 {-trace}     \csname s@fct@#1\endcsname
390 }%
391 {/2ekernel | package | autoload}

```

\try@size@range This macro tries to find a suitable range for requested size (specified by `\f@size`) in `\font@info`. All the relevant action is done in `\extract@rangefontinfo`. All that needs to be done is to stuff in the token list in `\font@info` so that `\extract@rangefontinfo` can inspect it. Note the `<-*\@nil><` token at the end to stop scanning.

```

392 {/2ekernel | def2 | autoload}%
393 \def\try@size@range{%
394     \expandafter\extract@rangefontinfo\font@info <-*>\@nil<\@nnil
395 }%
396 {/2ekernel | def2 | autoload}

```

\try@size@substitution This is the last thing that can be tried. If the desired `\f@size` is found neither among the simple size specifications nor in one of the ranges the whole list of size specifications is searched for a nearby simple size.

```

397 {/2ekernel | def1}%
398 \gdef\try@size@substitution{%

```

First we do some initializations. `\@tempdimb` will hold the difference between the wanted size and the best solution found so far, so we initialise it with `\maxdimen`. The macro `\best@size` will hold the best size found, nothing found is indicated by the empty value.

```

399  \@tempdimb \maxdimen
400  \let \best@size \empty

```

Now we loop over the specification

```

401  \expandafter \try@simples \font@info <\number\@M>\@nil<\@nnil
402 }%
403 {/2ekernel | def1}%
404 {*autoload}%
405 \def\try@size@substitution{\try@simples\try@size@substitution}%
406 {/autoload}

```

\font@submax The macro `\font@submax` records the maximal deviation from the desired size encountered so far. Its value is used in a warning message at `\end{coument}`. The macro `\fontsubfuzz` contains the amount that will not cause terminal warnings (warnings still go into the transcript file).

```

407 {/2ekernel | autoload}%
408 \def\font@submax{0pt}%
409 \def\fontsubfuzz{.4pt}%
410 {/2ekernel | autoload}%
411 {+package}\def\fontsubfuzz{0pt}

```

\try@simples `\try@simples` goes through a font shape definition in the input until it recognizes the tokens `<*\@nil><`. It looks for simple sizes to determine the two closest sizes. It is assumed that simple sizes are in increasing order.

```

412 <*2ekernel | def1>
413 \gdef\try@simples#1<#2>{%
414   \tryif@simple#2->\tryif@simple}
415 </2ekernel | def1>
416 <*autoload>
417 \def\try@simples{\@ autoload{fss1}}
418 </autoload>
```

\tryis@simple \tryis@simple is similar to \is@range. If it sees a simple size, it checks it against the value of \f@size and sets \lower@font@size or \higher@font@size. In the latter case, it stops the iteration. By adding <\number\@M> at the end of the line we always have an end point. This is a hack which probably should be corrected.

First it checks whether it is finished already, then whether the size specification in question is a simple one.

```

419 <*2ekernel | def1>
420 \gdef\tryif@simple#1-#2\tryif@simple{%
```

Most common case for \reserved@f first:

```

421 \let \reserved@f \try@simples
422 \if>#2%
```

If so, it compares it to the value of \f@size. This is done using a dimen register since there may be fractional numbers.

```

423   \dimen@ #1\p@
424   \ifdim \dimen@<\@M\p@
```

If \dimen@ is \@M\p@ we have reached the end of the fontspec (hopefully) otherwise we compare the value with \f@size and compute in \tempdimc the absolute value of the difference between the two values.

```

425   \ifdim \f@size\p@<\dimen@
426     \tempdimc \dimen@
427     \advance\tempdimc -\f@size\p@
428   \else
429     \tempdimc \f@size\p@
430     \advance\tempdimc -\dimen@
431   \fi
```

The result is then compared with the smallest difference we have encountered, if the new value (in \tempdimc is smaller) we have found a size which is a better approximation so we make it the \best@size and adjust \tempdimb.

```

432   \ifdim \tempdimc<\tempdimb
433     \tempdimb \tempdimc
434     \def \best@size{#1}%
435   \fi
```

When we have reached the end of the fontspec we substitute the best size found (if any). We code this inline to save macro space; in the past this was done by a macro called \subst@size.

```
436 \else
```

\subst@size This macro substitutes the size recorded in \best@size for the unavailable size \f@size. \font@submax records the maximum difference between desired size and selected size in the whole run.

```

437 % \% \subst@size          %% coded inline
438 % \% \def\subst@size{%
```

```

439  \ifx \external@font\empty
440    \ifx \best@size\empty
441    \else
442      \ifdim \tempdimb>\font@submax \relax
443        \xdef \font@submax {\the\tempdimb}%
444      \fi
445      \let \f@user@size \f@size
446      \let \f@size \best@size
447      \ifdim \tempdimb>\fontsubfuzz\relax
448        \font@warning{Font\space shape\space
449          '\curr@fontshape'\space in\space size\space
450          <\f@user@size>\space not\space available\MessageBreak
451          size\space <\f@size>\space substituted}%
452      \fi
453      \try@simple@size
454      \do@subst@correction
455    \fi
456  \fi
457 % %}

```

This brings us back into the main part of `\tryif@simple`. Finally we get rid of any rubbish left over on the input stack.

```

458   \let \reserved@f \remove@to@nnil
459   \fi
460 \fi

```

If it's a range iterate also.

```

461 \reserved@f}
462 ⟨/2ekernel | def1⟩

```

33.1 Sizefunctions

In the following we define some useful size functions.

- `\s@fct@` This is the default size function. Mandatory argument is an external font name, optional argument a scale factor. The font is scaled to `\f@size` if no optional argument is present, and to `\f@size` multiplied by the optional argument otherwise.

```

463 ⟨*2ekernel | autoload⟩
464 \DeclareSizeFunction{}{\empty@sfcnt\font@warning}
465 \DeclareSizeFunction{s}{\empty@sfcnt\font@info}
466 ⟨/2ekernel | autoload⟩
467 ⟨*2ekernel | def2 | autoload⟩
468 \def\empty@sfcnt#1{%
469   \tempdimb \f@size\p@
470   \ifx\optional@arg\empty
471   \else
472     \tempdimb \optional@arg\tempdimb
473     #1{Font\space shape\space '\curr@fontshape'\space
474       will\space be\MessageBreak
475       scaled\space to\space size\space \the\tempdimb}%
476   \fi
477   \edef\external@font{\mandatory@arg\space at\the\tempdimb}%
478 ⟨/2ekernel | def2 | autoload⟩

```

<code>\s@fct@gen \s@fct@sgen</code>	This size function generates the external name from the mandatory argument and the requested user size, and thus can be used for external names where the size is encoded in the font name. The optional argument a scale factor. The font is scaled to <code>\f@size</code> if no optional argument is present, and to <code>\f@size</code> multiplied by the optional argument otherwise.
	<pre> 479 (*2ekernel autoload) 480 \DeclareSizeFunction{gen}{\gen@sfcnt@\font@warning} 481 \DeclareSizeFunction{sgen}{\gen@sfcnt@\font@info} 482 (/2ekernel autoload) 483 (*2ekernel def2 autoload) 484 \def\gen@sfcnt{% 485 \edef\mandatory@arg{\mandatory@arg\f@size}% 486 \empty@sfcnt} 487 (/2ekernel def2 autoload) </pre>
<code>\s@fct@genb \s@fct@sgenb</code>	This size function is similar to <code>gen</code> , but for fonts where the size is encoded in the font name in centipoins, as in the DC fonts version 1.2. The font is scaled to <code>\f@size</code> if no optional argument is present, and to <code>\f@size</code> multiplied by the optional argument otherwise.
	<pre> 488 (*2ekernel autoload) 489 \DeclareSizeFunction{genb}{\genb@sfcnt@\font@warning} 490 \DeclareSizeFunction{sgenb}{\genb@sfcnt@\font@info} 491 (/2ekernel autoload) 492 (*2ekernel def2 autoload) 493 \def\genb@sfcnt{% 494 \edef\mandatory@arg{\mandatory@arg\expandafter\genb@x\f@size..\@C}% 495 \empty@sfcnt} 496 (/2ekernel def2 autoload) </pre>
<code>\genb@x \genb@y</code>	The auxiliary macros <code>\genb@x</code> and <code>\genb@y</code> are used to convert the <code>\f@size</code> into centipoins.
	<pre> 497 (*2ekernel def2 autoload) 498 \def\genb@x#1.#2.#3\@C{\two@digits{#1}\genb@y#200\@C} 499 \def\genb@y#1#2#3\@C{#1#2} 500 (/2ekernel def2 autoload) </pre>
<code>\s@fct@sub</code>	This size function handles font substitution. The mandatory argument is a family/series/shape combination, the optional argument (if present) is ignored. The font encoding scheme cannot be changed. Therefore, the first thing we do is to prepend the encoding scheme.
	<pre> 501 (*2ekernel autoload) 502 \DeclareSizeFunction{sub}{\sub@sfcnt@\font@warning} 503 \DeclareSizeFunction{ssub}{\sub@sfcnt@\font@info} 504 (/2ekernel autoload) 505 (*2ekernel def2 autoload) 506 \def\sub@sfcnt#1{% 507 \edef\mandatory@arg{\f@encoding/\mandatory@arg}% </pre>
	Next action is split the arg into its individual components and allow for a late font shape load.
	<pre> 508 \begingroup </pre>

```

509      \expandafter\split@name\mandatory@arg/\@nil
510      \try@load@fontshape
511  \endgroup

```

Then we record the current `\f@size` since it may get clobbered.

```
512  \let\f@user@size\f@size
```

Then we check whether this new combination is defined and give an error message if not. In this case we also switch to `\error@fontshape`.

```

513  \expandafter
514  \ifx\csname\mandatory@arg\endcsname\relax
515      \errmessage{No\space declaration\space for\space
516                  shape\space \mandatory@arg}%
517      \error@fontshape
518  \else

```

Otherwise we warn the user about the substitution taking place.

```

519      #1{Font\space shape\space '\curr@fontshape'\space in\space
520          size\space <\f@size>\space not\space available\MessageBreak
521          Font\space shape\space '\mandatory@arg'\space tried\space
522          instead}%
523      \expandafter\split@name\mandatory@arg/\@nil
524  \fi

```

Then we restart the font specification scan by calling `\get@external@font`.

```
525  \edef\f@size{\f@user@size}%
526  \get@external@font
```

Finally `\do@subst@correction` is called to get the font name right.

```
527  \do@subst@correction
528 }
529 </2ekernel | def2 | autoload>
```

\s@fct@subf The `subf` size function allows substitution of another font. The mandatory argument is the external name of the font to be substituted, the optional argument a size scaling factor like in the default size function. The main difference to the default size function is the warning message.

```

530 <*2ekernel | autoload>
531 \DeclareSizeFunction{subf}{\subf@sfcnt@\font@warning}
532 \DeclareSizeFunction{ssubf}{\subf@sfcnt@\font@info}
533 </2ekernel | autoload>
534 <*2ekernel | def2 | autoload>
535 \def\subf@sfcnt#1{%
536     #1{Font\space shape\space '\curr@fontshape'\space in\space
537         size\space \f@size\space not\space available\MessageBreak
538         external\space font\space '\mandatory@arg'\space used}%
539     \empty@sfcnt#1%
540 }
541 </2ekernel | def2 | autoload>
```

\s@fct@fixed The `fixed` size function is for using a font at a different size than requested. A warning message is printed, and the external font to be used is taken from the mandatory argument. If an optional argument is present it is used as the ‘at’ size for the font. Otherwise the font is loaded at its design size.

```
542 <*2ekernel | autoload>
```

```
543 \DeclareSizeFunction{fixed}{\fixed@sfcnt\@font@warning}
544 \DeclareSizeFunction{sfixed}{\fixed@sfcnt\@font@info}
545 </2ekernel | autoload>
546 <*2ekernel | def2 | autoload>
547 \def\fixed@sfcnt#1{%
548   \ifx\optional@arg\@empty
549     \let\external@font\mandatory@arg
550   \else
551     \edef\external@font{\mandatory@arg\space at\optional@arg pt}%
552   \fi
553 #1{External\space font\space '\external@font'\space loaded\space
554   for\space size\MessageBreak
555   <\f@size>}%
556 }
557 </2ekernel | def2 | autoload>
```

File q

ltfsscmp.dtx

This file contains the implementation of commands giving compatibility with the original ‘NFSS1’ release of the Font Selection Scheme.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

34 Compatibility code for NFSS release 1

There have been a couple of commands which became obsolete with NFSS2. In the past they have been still part of the kernel code to make it possible to process old packages using those commands but since they take up valuable space we decided to remove them and instead auto-load their definitions if they are actually encountered in some file.

Thus the following code doesn’t really belong to this file but I put it here for the moment until finally a documented version of `ltfss.dtx` is available.

[auto-loading not activated]

```
\new@fontshape
\subst@fontshape
\extra@def
\default@mextra
\define@mathalphabet
\define@mathgroup
```

These macros are the interfaces in NFSS1 which shouldn’t be used any longer. We will define them to call the macro `\scan@fontshape` which is an internal macro that loads the real definitions and then to execute themselves again. Once this auto-loading has happened they have the definition shown below and thus execute their real code directly.

```
1 {*autoload}
2 \def\new@fontshape{\scan@fontshape\new@fontshape}
3 \def\subst@fontshape{\scan@fontshape\subst@fontshape}
4 \def\extra@def{\scan@fontshape\extra@def}
5 \def\default@mextra{\scan@fontshape\default@mextra}
6 \def\define@mathalphabet{\scan@fontshape\define@mathalphabet}
7 \def\define@mathgroup{\scan@fontshape\define@mathgroup}
```

```
\scan@fontshape
```

Here is the kernel definition for `\scan@fontshape` which loads the actual definitions from the file `nfsscmp.def`.

```
8 \def\scan@fontshape{\input{nfsscmp.def}}
```

The following definitions are now placed into the auto-load file.

Since we don’t know when this file will be read in we need to provide ourselves with standard `\catcode` settings. This is done by placing all definitions in a group and calling `\nfss@catcodes`. But this macro will also disable spaces which isn’t very appropriate for the following code because it contains a lot of helper messages. Therefore we change this back.

```
9 \begingroup
10 \nfss@catcodes
11 \catcode`\ =10\relax
12 {/autoload}
13 {*compat}
```

\new@fontshape The interface is now \DeclareFontShape.

```
14 \gdef\new@fontshape#1#2#3#4{%
15     \warn@rel@i\new@fontshape\DeclareFontShape
16     \expandafter\scan@fontshape\@gobble#4<\@nil><>%
17     \DeclareFontShape U{#1}{#2}{#3}\reserved@f}
18 \onlypreamble\new@fontshape
```

\warn@rel@i The warning message used above.

```
19 \gdef\warn@rel@i#1#2{%
20   \@font@warning{*** NFSS release 1 command
21   \noexpand#1found\MessageBreak
22   *** Update by using release 2 command
23   \string#2.\MessageBreak
24   *** Recovery is probably possible}%
25 }
26 \onlypreamble\warn@rel@i
```

\scan@fontshape This will scan the old font shape definition syntax.

```
27 \gdef\scan@fontshape{%
28   \let\reserved@f\@empty
29   \let\reserved@e\@empty % holds last info
30   \scan@@fontshape
31 }
32 \onlypreamble\scan@fontshape
```

\scan@@fontshape

```
33 \gdef\scan@@fontshape#1>#2#3<%
34   \ifx\@nil#1%
35     \edef\reserved@f{\reserved@f\reserved@e}%

104     ^J \space*** TYPE H for Help%
105   }%
106   {Please look at the file usrguide.tex for hints on
107     how to resolve this problem.}%
108 \else
109   \warn@rel@i\newmathalphabet\DeclareMathAlphabet
110 \fi
111 \@ifstar\newmathalphabet@@@%
112   \newmathalphabet@@%
113 \gdef\newmathalphabet@@#1{\DeclareMathAlphabet#1{U}{}{}{}}
114 \gdef\newmathalphabet@@@#1#2#3#4{%
115   \DeclareMathAlphabet{#1}{U}{#2}{#3}{#4}}
116 \@onlypreamble\newmathalphabet
117 \@onlypreamble\newmathalphabet@@
118 \@onlypreamble\newmathalphabet@@@

\if@no@font@opt
\@no@font@optfalse 119 \global\let\if@no@font@opt\iftrue
120 \gdef\@no@font@optfalse{\let\if@no@font@opt\iffalse}

\define@mathalphabet This is a case where dying is best.

121 \gdef\define@mathalphabet{%
122   \err@rel@i\define@mathalphabet\DeclareMathAlphabet
123 }
124 \@onlypreamble\define@mathalphabet

\define@mathgroup And here is another one

125 \gdef\define@mathgroup{%
126   \err@rel@i\define@mathgroup\DeclareSymbolFont
127 }
128 \@onlypreamble\define@mathgroup
129 </compat>

\addtoversion \addtoversion is the old form.

130 \def\addtoversion#1#2{%
131   \warn@rel@i\addtoversion\SetMathAlphabet
132   \SetMathAlphabet#2{#1}{U}}
133 \@onlypreamble\addtoversion

```

That finishes the definitions for the old interfaces — but first we better finish the group.

```
134 <*autoload>
135 \endgroup
136 </autoload>
```

File r

ltfssdcl.dtx

This file contains the main implementation of the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

Warning: The macro documentation is still basically the documentation from the first NFSS release and therefore in some cases probably not completely accurate.

35 Interface Commands

\in@ \c@in is a utility macro with two arguments. It determines whether its first argument occurs in its second (after expanding it) and sets the switch \if@in accordingly.

```
1 (*2ekernel | autoload)
2 \def\in@#1#2{%
3   \def\in@@##1#1##2##3\in@{%
4     \ifx\in@@#2\in@false\else\in@true\fi}%
5   \in@@#2#1\in@\in@}
6 \newif\ifin@
```

Before the \begin{document} command several *(math versions)* and *(math alphabet identifiers)* may be declared. In principle, there should be exactly one family/series/shape combination be declared for each version/alphabet pair. But we want to allow for defaults as well for automagical filling of holes.

While building the tables for math alphabet identifiers and math versions we keep several lists:

- the list of all math versions, \version@list, each entry prefixed by the control sequence \version@elt, i.e. this list has the following form

$$\begin{aligned} \text{\version@elt}\langle\textit{version}_1\rangle\text{\version@elt}\langle\textit{version}_2\rangle\dots \\ \text{\version@elt}\langle\textit{version}_n\rangle \end{aligned}$$

- the list of all math alphabet identifiers. Here every entry has the form:

$$\begin{aligned} \text{\group@elt}\langle\textit{math group number}\rangle \\ \{\{\langle\textit{default family}\rangle\}\{\langle\textit{default series}\rangle\}\{\langle\textit{default shape}\rangle\}\}. \end{aligned}$$

- Each defined math alphabet identifier holds a list containing Information about the *versions* for which it is defined. This list has a more complicated structure: it looks as follows:

$$\begin{aligned} \text{\set@alpha}\langle\textit{the alphabet identifier itself}\rangle \\ \text{\reserved@c}\langle\textit{math version}\rangle\langle\textit{font info}\rangle \\ \dots \\ \text{\@nil} \end{aligned}$$

where *(font info)* is either \reserved@e (if the combination is not defined yet) or

```
 {{<family>}{<series>}{<shape>}}
```

\version@list We initialize the version list to be empty.

```
7 \let\version@list=\empty
8 \onlypreamble\version@list
```

\version@elt

```
9 \let\version@elt\relax
10 \onlypreamble\version@elt
```

\new@mathversion The macro \new@mathversion is called with the version control sequence as its argument.

```
11 %\def\new@mathversion#1{%
12 %  \expandafter\in@\expandafter#1\expandafter{\version@list}%
13 %  \ifin@
```

If so it prints an error message. The \next macro is used to get rid of the four characters \mv@ that would otherwise appear at the begin of the version name in the error message.

```
14 %      \@latex@error{Math version
15 %                      '\expandafter\@gobblefour\string#1'
16 %                      already defined}\@eha
```

Otherwise we have a new version, and we can proceed with entering it into the tables. We add it to \version@list. This is very easy: we define \version@elt (which is the delimiter in \version@list) to protect itself and the following token from being expanded and simply redefine \version@list.

```
17 %  \else
18 %    \global\expandafter\newcount\csname c@\expandafter
19 %                                \gobble\string#1\endcsname
20 %    \global\csname c@\expandafter
21 %                                \gobble\string#1\endcsname\@ne
22 %    \def\version@elt{\noexpand\version@elt\noexpand}%
23 %    \edef\version@list{\version@list\version@elt#1}%
```

Then we prepare to enter the new version into all math alphabet identifier lists. Remember that these lists use \reserved@c as delimiter, and that there appears the control sequence \reserved@e that must not be expanded. Therefore we take suitable precautions.

```
24 %      \def\reserved@c{\noexpand\reserved@c\noexpand}%
25 %      \let\reserved@e\relax
```

We will now go through the \alpha@list to process every *math alphabet identifier* in turn. Since this list has \group@elt as a delimiter we define this control sequence. It has three arguments as every entry consists of three items (as explained above).

```
26 %      \def\group@elt##1##2##3{%
```

The first of these arguments is the *<math alphabet identifier>*. We redefine it by appending the information about the new version at the end of the list contained in it. However, there is one subtlety: the definitions for `\reserved@c` and `\reserved@e` made above prevent the main part of the list from being expanded. But we still have to take care of the header and the trailer. To do this we remove the trailer by means of the macro `\remove@nil` which also protect the header from being expanded. Its definition is given below. Now we can prepare to add the new version.

```
27 %           \edef##1{\expandafter\remove@nil##1%
28 %                     \reserved@c
29 %                     #1%
30 %                     \reserved@e
31 %                     \noexpand\@nil}}%
```

Finally we call `\alpha@list` which will now execute the macro `\group@elt` once for every defined *<math alphabet identifier>*. And that's all for now.

```
32 %     \alpha@list
33 %   \fi}
```

\alpha@list As we explained above every entry in `\alpha@list` has the form
`\alpha@elt`
<alphabet identifier><internal group number><default font assignments>...
We initialize it to `\empty`.
34 `\let\alpha@list\empty`
35 `\onlypreamble\alpha@list`

```
\alpha@elt
36 \let\alpha@elt\relax
37 \onlypreamble\alpha@elt
```

\newgroup Start the group (fam) allocation at 0. (Doesn't belong here.)
38 `\count18=-1`

\stepcounter

\select@group We surround `\select@group` with braces so that functions using it can be used directly after `_` or `^`. However, if we use oldstyle syntax where the math alphabet doesn't have arguments (ie if `\math@bgroup` is not `\bgroup`) we need to get rid of the extra group.

```

597   \expandafter\@xxDeclareMathDelimiter
598 \fi
599 #1}
600 \onlypreamble\DeclareMathDelimiter

```

\@xxDeclareMathDelimiter This macro checks if the second arg is a “math type” such as `\mathopen`. The undocumented original code didn’t use math types when the delimiter was a single letter. For this reason the coding is a bit strange as it tries to support the undocumented syntax for compatibility reasons.

```
601 \def\@xxDeclareMathDelimiter#1#2#3#4{%
```

7 is the default value returned in the case that `\mathchar@type` is passed something unexpected, like a math symbol font name. We locally move `\mathalpha` out of the way so if you use that the right branch is taken. This will still fail if an explicit number 7 is used!

```

602 \begingroup
603   \let\mathalpha\mathord
604   \ifnum7=\mathchar@type{#2}%
605     \endgroup

```

If this branch is taken we have old syntax (5 arguments).

```

606   \expandafter\@firstofone
607 \else

```

If this branch is taken `\mathchar@type` is different from 7 so we assume new syntax. In this case we also use the arguments to set up the letter as a math symbol for the case where it is not used as a delimiter.

```

608   \endgroup
609   \DeclareMathSymbol{#1}{#2}{#3}{#4}%

```

Then we arrange that `\@xDeclareMathDelimiter` only gets #1, #3, #4 ... as it does not expect a math type as argument.

```

783     \expandafter\DeclareSymbolFontAlphabet@%
784         \csname @\expandafter\gobble\string#1\endcsname{#2}#1}
785 \onlypreamble\DeclareSymbolFontAlphabet

```

\DeclareSymbolFontAlphabet@

```
786 \def\DeclareSymbolFontAlphabet@#1#2#3{%
```

We use the switch `\if@tempswa` to decide if we can declare this symbol font alphabet.

```
787     \if@tempswa
```

First check if #2 is known to be a symbol font

```
788 \expandafter\in@\csname sym#2\expandafter\endcsname
789     \expandafter{\group@list}%
790 \ifin@
```

Check if #1 is defined as a math alphabet defined via `\DeclareMathAlphabet`:

```
791 \expandafter\in@\expandafter#1\expandafter{\alpha@list}%
792 \ifin@
```

If so remove it from the `\alpha@list` and from all math version macros.

```
793     @font@info{Redeclaring math alphabet \string#3}%
794     \toks@{}%
795     \def\alpha@elt##1##2##3{%
796         \ifx##1\else\addto@hook\toks@{\alpha@elt##1##2##3}\fi}%
797     \alpha@list
798     \xdef\alpha@list{\the\toks@}%
```

Now we loop over all versions and remove the math alphabet:

```
799 \def\version@elt##1{%
800     \begingroup
801     \toks@{}%
802     \def\getanddefine@fonts####1####2{%
803         \addto@hook\toks@{\getanddefine@fonts####1####2}}%
804     \def\install@mathalphabet##1##2{%
805         \ifx##1\else
```

```

806          \addto@hook\toks@{\install@mathalphabet
807                      #####1{####2}}\fi}%
808          ##1%
809          \xdef##1{\the\toks@}%
810          \endgroup
811          }%
812          \version@list
813      \else

```

If #3 is not defined as a math alphabet check if it is defined at all:

```

814      \expandafter\ifx
815      \csname\expandafter\gobble\string#1\endcsname
816      \relax

```

If it is undefined, fine otherwise check if it is a math alphabet defined via `\DeclareSymbolFontAlphabet`:

```

817      \else
818          \edef\reserved@a{%
819              \noexpand\in@{\string\use@mathgroup}{\meaning#1}%
820          \reserved@a
821          \ifin@
822              \font@info{Redeclaring math alphabet \string#3}%
823          \else

```

Since the command #3 is defined to be something which is not a math alphabet we have to skip redefining it.

```

824          \tempswafalse
825          \if@latex@error{Command ‘\string#3’ already defined}\@eha
826          \fi
827          \fi
828          \fi
829      \else

```

Since the symbol font is not known we better skip defining this alphabet.

```

830      \tempswafalse
831      \if@latex@error{Unknown symbol font ‘#2’}\@eha
832      \fi
833      \if@tempswa

```

When we reach this point we are allowed to define #1 to be a symbol font math alphabet. This means that we have to set it to

```
\use@mathgroup <math-settings> \sym<name>
```

The `<math-settings>` are the one for the encoding that is used in the font shape where `\sym<name>` is pointing to. This means that we have to get it from the information stored in `\group@list`. Thus we loop through that list after defining `\group@elt` in a suitable way.

```

834      \def\group@elt##1##2{%
835          \expandafter\ifx\csname sym#2\endcsname##1%
836          \expandafter\reserved@a\string##2\@nil
837          \fi}%
838      \def\reserved@a##1##2##3\@nil{%
839          \def\reserved@a{##2}%
840      \group@list
841      \toks@{\relax\ifmmode \else \non@alpherr#1\fi}%

```

```
842     \edef#1{\the\toks@  
843             \noexpand\use@mathgroup  
844             \expandafter\noexpand\csname M@\reserved@a\endcsname  
845             \csname sym#2\endcsname} %  
846     \def#3{\protect#1} %  
847 \fi  
848 }  
849 \onlypreamble\DeclareSymbolFontAlphabet@  
850 </2ekernel | autoload>
```

File s

ltfssini.dtx

This file contains the top level L^AT_EX interface to the font selection scheme commands. See other parts of the L^AT_EX distribution, or *The L^AT_EX Companion* for higher level documentation of these commands.

36 NFSS Initialisation

Finally, there are six commands that are to be used in L^AT_EX and that we will therefore protect against expansion at the wrong point: \fontfamily, \fontseries, \fontshape, \fontsize, \selectfont, and \mathversion.

36.1 Providing math *versions*

L^AT_EX provides two *versions*. We call them *normal* and *bold*, respectively.

```
1 \DeclareMathVersion{normal}
2 \DeclareMathVersion{bold}
```

Now we define the standard font change commands. We don't allow the use of \rmfamily etc. in math mode.

First the changes to another *family*:

```
3 \DeclareRobustCommand\rmfamily
4     {\not@math@\alpha lphab et\rmfamily\mathrm
5      \fontfamily\rmdefault\selectfont}
6 \DeclareRobustCommand\sffamily
7     {\not@math@\alpha lphab et\sffamily\mathsf
8      \fontfamily\sfdefault\selectfont}
9 \DeclareRobustCommand\ttfamily
10    {\not@math@\alpha lphab et\ttfamily\mathtt
11     \fontfamily\ttdefault\selectfont}
```

Then the commands changing the *series*:

```
12 \DeclareRobustCommand\bfseries
13     {\not@math@\alpha lphab et\bfseries\mathbf
14      \fontseries\bfdefault\selectfont}
15 \DeclareRobustCommand\mdseries
16     {\not@math@\alpha lphab et\mdseries\relax
17      \fontseries\mddefault\selectfont}
18 \DeclareRobustCommand\upshape
19     {\not@math@\alpha lphab et\upshape\relax
20      \fontshape\updefault\selectfont}
```

Then the commands changing the *shape*:

```
21 \DeclareRobustCommand\slshape
22     {\not@math@\alpha lphab et\slshape\relax
23      \fontshape\sldefault\selectfont}
24 \DeclareRobustCommand\scshape
25     {\not@math@\alpha lphab et\scshape\relax
26      \fontshape\scdefault\selectfont}
27 \DeclareRobustCommand\itshape
28     {\not@math@\alpha lphab et\itshape\mathit}
```

```
29           \fontshape\itdefault\selectfont}
```

We also have to define the *emphasize* font change command (i.e. `\em`). This command will look is the current font is sloped (i.e. has a positive `\fontdimen1`) and will then select either `\upshape` or `\itshape`.

```
30 \DeclareRobustCommand{\em}{%
31     \ifdim \fontdimen1ne\font > \z@%
32         \upshape \else \itshape \fi}
```

`\not@math@alphabet` This function generates an error message when it is called in math mode. The same function should be defined in `newlfont.sty`.

```
33 \def\not@math@alphabet#1#2{%
34     \relax
35     \ifmmode
36         \@latex@error{Command \noexpand#1 invalid in math mode}%
37         \%
38         Please
39         \ifx#2\relax
40             define a new math alphabet^{#1}%
41             if you want to use a special font in math mode%
42         \else
```

We have to a `\noexpand` below to prevent expansion of #2. In case of #1 we can omit this (due to the current definition of robust commands since they do come out right there :-).

```
43     use the math alphabet \noexpand#2 instead of
44     the #1 command%
45     \fi
46     .
47 }%
48 \fi}
```

Finally we provide two abbreviations to switch to the L^AT_EX *versions*.

```
49 \def\boldmath{\not@mathboldmath
50     \mathversion{bold}}
51 \def\unboldmath{\not@mathunboldmath
52     \mathversion{normal}}
```

Here we switch to the default math version by defining the internal macro `\math@version`. We dare not to call `\mathversion` at this place because this would call `\glb@settings`.

```
53 \def\math@version{normal}
```

36.2 Miscellaneous

`\newfont` We start by defining a few macros that are part of standard L^AT_EX's user interface.

`\symbol` The use of these functions is not encouraged, but they will allow to process older documents without changes to the source.

```
54 \def\newfont#1#2{\ifdefinable#1{\font#1=#2\relax}%
55 \def\symbol#1{\char #1\relax}}
```

`\@setfontsize` This abbreviation is used by L^AT_EX's user level size changing commands, such as `\large`.

```
56 \def\@setfontsize#1#2#3{\not@math#1%
```

For the benefit of people relying on keeping the name of the current font command saved in `\@currsize` we define it. To ensure that `\@setfontsize` keeps being robust we omit this assignment during times where `\protect` differs from `\@typeset@protect`.

```
57   \ifx\protect\@typeset@protect
58     \let\@currsize#1%
59   \fi
60   \fontsize{#2}{#3}\selectfont
```

For compatibility we also define `\@setsizesize` the 209 command

```
61 <*compat>
62 \def\@setsizesize#1#2#3#4{\@setfontsize#1[#4]{#2}}
63 </compat>
```

`\oldstylenums` This macro implements old style numerals but only works if we assume that the standard math fonts are used. Thus it needs changing in case other math encodings are used.

```
64 \def\oldstylenums#1{%
65   \begingroup
```

Provide spacing using the interword space of the current font.

```
66   \spaceskip\fontdimen\tw@\font
```

Then switch to the math italic font. We don't change the current value of `\f@series` which means that you can use bold numerals if `\bfseries` is in force. As family we use `\rmdefault` which means that this only works if there exist an OML encoded version of that font or rather a corresponding .fd file (which is the case for standard L^AT_EX fonts even though they only contain substitutions).

```
67   \usefont{OML}{\rmdefault}{\f@series}{it}%
68   \mathgroup\symletters #1%
69   \endgroup
70 }
```

`\hexnumber@` To set up L^AT_EX's special math character definitions we first provide a macro to generate hexadecimal numbers. It is a rather simple `\ifcase`.

```
71 \def\hexnumber@#1{\ifcase\number#1
72 0\or 1\or 2\or 3\or 4\or 5\or 6\or 7\or 8\or
73 9\or A\or B\or C\or D\or E\or F\fi}
```

`\nfss@text` In its simplest form `\nfss@text` is an `\mbox`. This will produce unbreakable text outside math and inside math you will get text with the same fonts as outside. The only drawback is that such item won't change sizes in subscripts. But this behavior can be easily changed. With the `amstex` style option one will get a sub style called `amstext` which will redefine the `\nfss@text` macro to produce correct text in all sizes.

We have to use `\def` instead of the shorter `\let` since `\mbox` is undefined when we reach this point.

```
74 \def\nfss@text#1{{\mbox{#1}}}
```

`\copyrightt` The definition of `\copyright` was changed so that it works in other type styles, and to make it robust. We leave the family untouched so that the copyright notice will come out differently if a different font family is in use. This command is commented out, since it is now defined in ltoutenc.dtx.

```

75 \%{\DeclareRobustCommand\copyright
76 %      {{\ooalign{\hfil
77 %        \raise.07ex\hbox{\mdseries\upshape c}\hfil\crcr
78 %        \mathhexbox20D}}}

```

\normalfont \reset@font \p@reset@font The macro `\reset@font` is used in L^AT_EX to switch to a standard font, in order to initialize the current font in situations where typesetting is done in a new visual context (e.g. in a footnote). We define it here to allow the test for the new L^AT_EX version above but nevertheless are able to run all kind of mixtures.

The user interface name for `\reset@font` is `\normalfont`:

```

79 \DeclareRobustCommand\normalfont
80             {\usefont{encodingdefault}
81              \familydefault
82              \seriesdefault
83              \shapedefault
84              \relax}
85 \let\reset@font\normalfont

```

We left out the special L^AT_EX fonts which are not automatically included in the base version of the font selection since these fonts contain only a few characters which are also included in the AMS fonts so anybody who is using these fonts doesn't need them. But for compatibility reasons we will define these symbols.

```

86 \def\not@base#1{\@latex@error
87   {Command \noexpand#1 not provided in base LaTeX2e}%
88   {Load the latexsym or the amsfonts package to
89    define this symbol}}
90 \def\mho{\not@base\mho}
91 \def\Join{\not@base\Join}
92 \def\Box{\not@base\Box}
93 \def\Diamond{\not@base\Diamond}
94 \def\leadsto{\not@base\leadsto}
95 \def\sqsubset{\not@base\sqsubset}
96 \def\sqsupset{\not@base\sqsupset}
97 \def\lhd{\not@base\lhd}
98 \def\unlhd{\not@base\unlhd}
99 \def\rhd{\not@base\rhd}
100 \def\unrhd{\not@base\unrhd}

```

We now initialize all variables set by `\DeclareErrorFont`. These values are not really important since they will be overwritten later on by the definition in `fontdef.ltx`.

However, if `fontdef.cfg` is corrupted then at least a hopefully suitable error font is present.

```

101 \DeclareErrorFont{OT1}{cmr}{m}{n}{10} %% don't modify this setting
102                                     %% overwrite it in fontdef.cfg
103                                     %% if necessary

```

We now load the customizable parts of NFSS.

```
104 \ifnum\inputlineno=\m@ne
```

Still using T_EX2. need a configuration file to avoid setting the 8bit characters.

```

105 \InputIfFileExists{fonttext.cfg}
106           {\typeout{=====^J%}

```

```

107          ^^J%
108          Local config file fonttext.cfg used^^J%
109          ^^J%
110          ======%
111          \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\#1}}%
112      }
113      {\typeout{!!!!!!!!!!!!!!}^^J%
114          !^^J%
115          ! You MUST use a fonttext.cfg file!^^J%
116          ! As you are still using TeX2!!!!^^J%
117          !^^J%
118          ! See the documentation file tex2.txt^^J%
119          !^^J%
120          !!!!!!!}%
121          \batchmode \@@end}
122 \else

```

With TEX3 can use the standard ltx file if no configuration file exists.

```

123 \InputIfFileExists{fonttext.cfg}
124     {\typeout{=====
125         ^^J%
126         Local config file fonttext.cfg used^^J%
127         ^^J%
128         =====}}%
129     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\#1}}%
130     }
131     {\input{fonttext.ltx}}
132 \fi
133 \let\@addtofilelist\@gobble

```

Ditto for math although I don't think that we will get a lot of customisation
:-)

```

134 \InputIfFileExists{fontmath.cfg}
135     {\typeout{=====
136         ^^J%
137         Local config file fontmath.cfg used^^J%
138         ^^J%
139         =====}}%
140     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\#1}}%
141     }
142     {\input{fontmath.ltx}}
143 \let\@addtofilelist\@gobble

```

Then we preload several fonts. This file might be customized *without* changing the behavior of the format (i.e. necessary font definitions will be loaded at runtime if they are not preloaded). This is done in the file preload.ltx.

```

144 \InputIfFileExists{preload.cfg}
145     {\typeout{=====
146         ^^J%
147         Local config file preload.cfg used^^J%
148         ^^J%
149         =====}}%
150     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,\#1}}%
151     }
152     {\input{preload.ltx}}

```

```
153 \let\@addtofilelist\gobble  
\@acci We also save the values of some accents in \@acci, \@accii and \@acciii so they  
\@accii can be restored by a minipage inside a tabling environment.  
\@acciii 154 \let\@acci\` \let\@accii\` \let\@acciii\=
```

\cal Here were the two old *alphabet identifiers*.
\mit

File t **fontdef.dtx**

37 Introduction

This file is used to generate the files `fonttext.ltx` (text font declarations) and `fontmath.ltx` (math font declarations), which are used during the format generation. It contains the declaration of the standard text encodings used at the site as well as a minimal subset of font shape groups that NFSS will look at to ensure that the specified encodings are valid.

The math part contains the setup for math encodings as well as the default math symbol declarations that belong to the encoding.

It is possible to change this setup (by using other fonts, or defaults) without losing the ability to process documents written at other sites. Portability in this sense means that a document will compile without errors. It does not mean, however, that identical output will be produced. For this it is necessary that the distributed setup is used at both installations.

38 Customization

You are not allowed to change this source file! If you want to change the default encodings and/or the font shape groups preloaded you should create a copy of `fonttext.ltx` under the name `fonttext.cfg` and change this copy. If L^AT_EX 2 _{ε} finds a file of this name it will use it, otherwise it uses the standard file which is `fontdef.ltx`.

If you don't plan to use Computer Modern much or at all, it might (!) be a good idea to make your own `fonttext.cfg`. Look at the comments below (docstrip module 'text') to see what should go into such a file.

To change the math font setup use a copy of `fontmath.ltx` under the name `fontmath.cfg` and change this copy. However, dealing with this interface is even more a job for an expert than changing the text font setup — in short, we don't encourage either.

Warning: please note that we don't support customised L^AT_EX versions. Thus, before sending in a bug report please try your test file with a L^AT_EX format which is not customised and send in the log from that version (unless the problem goes away).

Please note: the following standard encodings have to be defined in all local variants of `font....cfg` to guarantee that all L^AT_EX installations behave in the same way.

T1	Cork T _E X text encoding
OT1	old T _E X text encoding
U	unknown encoding
OML	old T _E X math letters encoding
OMS	old T _E X math symbols encoding
OMX	old T _E X math extension symbols encoding

Notice that some of these encodings are ‘old’ in the sense that we hope that they will be superseded soon by encoding standards defined by the \TeX user community. Therefore this set of default encodings may change in the future.

The first candidate is OT1 which will soon be replaced by T1, the official \TeX text encoding.

Warning: If you add additional encodings to this file there is no guarantee any longer that files processable at your installation will also be processable at other installations. Thus, if you make use of such an encoding in your document, e.g. if you intend to typeset in Cyrillic (OT2 encoding), you need to specify this encoding in the preamble of your document prior to sending it to another installation. Once the encoding is specified in that place in your document, the document is processable at all \LaTeX installations (provided they have suitable fonts installed).

For this reason we suggest that you define a short package file that sets up an additional encoding used at your site (rather than putting the encoding into this file) since this package can easily be shipped with your document.

39 The docstrip modules

The following modules are used to direct `docstrip` in generating external files:

driver	produce a documentation driver file
text	produce the file <code>fonttext.ltx</code>
math	produce the file <code>fontmath.ltx</code>
cfgtext	produce a dummy <code>fonttext.cfg</code> file
cfgmath	produce a dummy <code>fontmath.cfg</code> file

A typical `docstrip` command file would then have entries like:

```
\generateFile{fonttext.ltx}{t}{\from{fontdef.dtx}{text}}
```

40 A driver for this document

The next bit of code contains the documentation driver file for \TeX , i.e. the file that will produce the documentation you are currently reading. It will be extracted from this file by the `DOCSTRIP` program.

```
1 {*driver}
2 \documentclass{ltxdoc}
3 \GetFileInfo{fontdef.dtx}
4 \begin{document}
5   \DocInput{fontdef.dtx}
6 \end{document}
7 
```

41 The fonttext.ltx file

The identification is done earlier on with a `\ProvidesFile` declaration.

```
8 {*text}
9 \typeout{== Don't modify this file, use a .cfg file instead ==^^J}
```

41.1 Encodings

This file declares the standard encodings for text and math fonts. All others should be declared in packages or in the documents directly.

For every text encoding there are normally a number of encoding specific commands, e.g. accents, special characters, etc. (The definition for such a command might have to change when the encoding is changed, because the character is in a different position, or not available at all, or the accent is produced in a different way.) This is handled by a general mechanism which is described in `1toutenc.dtx`.

By convention, text encoding specific declarations, including the declaration `\DeclareFontEncoding`, are kept in separate file of the form `<enc>enc.def`, e.g. `ot1enc.def`. This allows other applications to make use of the declarations as well.

Similar to the default encoding, the loading of the encoding files for the two major text encodings shouldn't be changed. In particular, the `inputenc` package depends on this.

```
10 \input {omlenc.def}
11 \input {t1enc.def}
12 \input {ot1enc.def}      % <- should come after T1 for speed
13 \input {omsenc.def}
```

We then set the default text font encoding. This will hopefully change some day to T1. This setting should *not* be changed to produce a portable format.

```
14 \fontencoding{OT1}
```

If different encodings for text fonts are in use one could put the common setup into `\DeclareFontEncodingDefaults`. There is now a better mechanism so using this interface is discouraged!

```
15 \DeclareFontEncodingDefaults{}{}
```

Then we define the default substitution for every encoding. This release of L^AT_EX 2 _{ε} assumes that the ec fonts are available. It is possible to change this to point to some other font family (e.g., Times with the appropriate encoding if it is available) without making documents non-portable. However, in such a case documents will produce different page breaks at other sites. The substitution defaults can all be changed without losing portability as long as there are font shape definitions for the selected substitutions.

```
16 \DeclareFontSubstitution{T1}{cmr}{m}{n}
17 \DeclareFontSubstitution{OT1}{cmr}{m}{n}
```

For every encoding declaration, L^AT_EX 2 _{ε} will try to verify that the given substitution information makes sense, i.e. that it is impossible to go into an endless loop if font substitution happens. This is done at the moment the `\begin{document}` is encountered. L^AT_EX 2 _{ε} will then check that for every encoding the substitution defaults form a valid font shape group, which means that it will check if there is a `\DeclareFontShape` declaration for this combination. We will therefore load the

corresponding .fd files now. If we don't do this they would be loaded at verification time (i.e. at \begin{document} which would delay processing unnecessarily.

Warning: Please note that this means that you have to regenerate the format whenever you change any of these .fd files since L^AT_EX 2 _{ε} will not read .fd files if it already knows about the encoding/family combination.

The \nfss@catcodes ensures that white space is ignored in any definitions made in the fd files.

```
18 \begingroup
19 \nfss@catcodes
20 \input {t1cmr.fd}
21 \input {ot1cmr.fd}
22 \endgroup
```

We also load some other font definition files which are normally needed in a document. This is only done for processing speed and you can comment the next two lines out to save some memory. If necessary these files are then loaded when your document is processed. (Loading .fd files is a less drastic step compared to preloading fonts because the number of fonts is limited 255 at (nearly) every T_EX installation, while the amount of main memory is not a limiting factor at most installations.)

```
23 \begingroup
24 \nfss@catcodes
25 \input {ot1cmss.fd}
26 \input {ot1cmtt.fd}
27 \endgroup
```

Even with all the precautions it is still possible that NFSS will run into problems, for example, when a .fd file contains corrupted data. To guard against such cases NFSS has a very low-level fallback font that is installed with the following line.

```
28 \DeclareErrorFont{OT1}{cmr}{m}{n}{10}
```

This means, "if everything else fails use Computer Modern Roman normal shape at 10pt in the old text encoding". You can change the font used but the encoding should be the same as the one specified with \fontencoding above.

41.2 Defaults

To allow the use of \rmfamily, \sffamily, etc. in documents even if non-standard families are used we provide nine macros which hold the name of the corresponding families, series, and so on. This makes it easy to use other font families (like Times Roman, etc.). One simply has to redefine these defaults.

All these hooks have to be defined in this file but you can change their meaning (except for \encodingdefault) without making documents non-portable.

\rmdefault	The following three definitions set up the meaning for \rmfamily, \sffamily, and \sfdefault.
\sfdefault	
\ttdefault	29 \newcommand\rmdefault{cmr} 30 \newcommand\sfdefault{cmss} 31 \newcommand\ttdefault{cmtt}

```

\bfdefault Series changing commands are influenced by the following hooks.
\mddefault 32 \newcommand\bfdefault{bx}
            33 \newcommand\mddefault{m}

\itdefault Shape changing commands use the following hooks.
\slddefault 34 \newcommand\itdefault{it}
\scdefault 35 \newcommand\slddefault{sl}
\updefault 36 \newcommand\scdefault{sc}
            37 \newcommand\updefault{n}

\encodingdefault Finally we have the hooks that describe the behaviour of the \normalfont command. To stay portable, the definition of \encodingdefault should not be changed and should match the setting above for \fontencoding. All other values can be set according to your taste.
\familydefault 38 \newcommand\encodingdefault{OT1}
\seriesdefault 39 \newcommand\familydefault{\rmdefault}
\shapedefault 40 \newcommand\seriesdefault{\mddefault}
                41 \newcommand\shapedefault{\updefault}

This finishes the low-level setup in fonttext.ltx.
42 </text>

```

42 The fontmath.ltx file

The identification is done earlier on with a \ProvidesFile declaration.

```

43 (*math)
44 \typeout{== Don't modify this file, use a .cfg file instead ==^^J}

```

42.1 The font encodings used

```

45 \DeclareFontEncoding{OML}{}{}
46 \DeclareFontEncoding{OMS}{}{}
47 \DeclareFontEncoding{OMX}{}{}

```

Finally a declaration for U encoding which serves for all fonts that do not fit standard encodings. For math this sets up \noaccents@ providing for AMS-LATEX. This macro is used therein to handle accented characters if they are not supported by the font. In other words, if fonts with U encoding are used in math, all accents (like from \breve) are obtained from some other font that has them.

```
48 \DeclareFontEncoding{U}{}{\noaccents@}
```

The encodings for math are next:

```

49 \DeclareFontSubstitution{OML}{cmm}{m}{it}
50 \DeclareFontSubstitution{OMS}{cmsy}{m}{n}
51 \DeclareFontSubstitution{OMX}{cmex}{m}{n}
52 \DeclareFontSubstitution{U}{cmr}{m}{n}

53 \begingroup
54 \nfss@catcodes
55 \input {omlcmm.fd}
56 \input {oms cmsy .fd}
57 \input {omx cmex .fd}
58 \input {ucmr .fd}

```

```
59 \endgroup
```

42.1.1 Symbolfont and Alphabet declarations

We now define the basic symbol fonts used by L^AT_EX. These four symbol fonts must be defined by this file.

It is possible to make the symbol fonts point to other external fonts without losing the ability to process documents written at other sites, as long as one defines the same symbol font names with the same encodings, e.g. `operators` with OT1 etc. If other encodings are used documents become non-portable. Such a change should therefore be done in a package file.

```
60 \DeclareSymbolFont{operators}    {OT1}{cmr}{m}{n}
61 \DeclareSymbolFont{letters}      {OML}{cmm}{m}{it}
62 \DeclareSymbolFont{symbols}      {OMS}{cmsy}{m}{n}
63 \DeclareSymbolFont{largesymbols} {OMX}{cmex}{m}{n}
64 \SetSymbolFont{operators}{bold}{OT1}{cmr}{bx}{n}
65 \SetSymbolFont{letters}   {bold}{OML}{cmm}{b}{it}
66 \SetSymbolFont{symbols}   {bold}{OMS}{cmsy}{b}{n}
```

Below are the seven math alphabets which are defined by NFSS. Again they must be defined by this file. However, as before you can change the fonts used without losing portability, but you should be careful when changing the encoding since that may make documents come out wrong.

```
67 \DeclareSymbolFontAlphabet{\mathrm}{operators}
68 \DeclareSymbolFontAlphabet{\mathnormal}{letters}
69 \DeclareSymbolFontAlphabet{\mathcal}{symbols}
70 \DeclareMathAlphabet{\mathbf}{OT1}{cmr}{bx}{n}
71 \DeclareMathAlphabet{\mathsf}{OT1}{cmss}{m}{n}
72 \DeclareMathAlphabet{\mathit}{OT1}{cmr}{m}{it}
73 \DeclareMathAlphabet{\mathtt}{OT1}{cmtt}{m}{n}
```

Given the currently available fonts we cannot bold-en `\mathbf` and `\mathtt` but in principle one could use ‘ultra bold’ or something. The alphabets defined via `\DeclareSymbolFontAlphabet` will change automatically in a new math version if the corresponding symbol font changes.

```
74 \SetMathAlphabet{\mathsf}{bold}{OT1}{cmss}{bx}{n}
75 \SetMathAlphabet{\mathit}{bold}{OT1}{cmr}{bx}{it}
```

42.2 Math font sizes

The declarations below declare the text, script and scriptscript size to be used for each text font size.

All occurrences of sizes longer than a single character are replaced with the macro name that holds them, saving a number of tokens (but losing a bit of speed, so this may not stay this way).

```
76 \DeclareMathSizes{5}{5}{5}{5}
77 \DeclareMathSizes{6}{6}{5}{5}
78 \DeclareMathSizes{7}{7}{5}{5}
79 \DeclareMathSizes{8}{8}{6}{5}
80 \DeclareMathSizes{9}{9}{6}{5}
81 \DeclareMathSizes{\@xpt}{\@xpt}{7}{5}
82 \DeclareMathSizes{\@xipt}{\@xipt}{8}{6}
83 \DeclareMathSizes{\@xiipt}{\@xiipt}{8}{6}
```

```

84 \DeclareMathSizes{\@xivpt}{\@xivpt}{\@xpt}{7}
85 \DeclareMathSizes{\@xvipt}{\@xvipt}{\@xipt}{\@xpt}
86 \DeclareMathSizes{\@xxpt}{\@xxpt}{\@xivpt}{\@xipt}
87 \DeclareMathSizes{\@xxvpt}{\@xxvpt}{\@xxpt}{\@xvipt}

```

42.3 The math symbol assignments

We start by setting up math codes for most of the characters typed in directly from the keyboard. Most of them are normally already setup up in the same way by *IniTeX*. However, we repeat them here to have a complete setup which can be exchanged with another if desired.

42.3.1 The letters

```

88 \DeclareMathSymbol{a}{\mathalpha}{letters}{`a}
89 \DeclareMathSymbol{b}{\mathalpha}{letters}{`b}
90 \DeclareMathSymbol{c}{\mathalpha}{letters}{`c}
91 \DeclareMathSymbol{d}{\mathalpha}{letters}{`d}
92 \DeclareMathSymbol{e}{\mathalpha}{letters}{`e}
93 \DeclareMathSymbol{f}{\mathalpha}{letters}{`f}
94 \DeclareMathSymbol{g}{\mathalpha}{letters}{`g}
95 \DeclareMathSymbol{h}{\mathalpha}{letters}{`h}
96 \DeclareMathSymbol{i}{\mathalpha}{letters}{`i}
97 \DeclareMathSymbol{j}{\mathalpha}{letters}{`j}
98 \DeclareMathSymbol{k}{\mathalpha}{letters}{`k}
99 \DeclareMathSymbol{l}{\mathalpha}{letters}{`l}
100 \DeclareMathSymbol{m}{\mathalpha}{letters}{`m}
101 \DeclareMathSymbol{n}{\mathalpha}{letters}{`n}
102 \DeclareMathSymbol{o}{\mathalpha}{letters}{`o}
103 \DeclareMathSymbol{p}{\mathalpha}{letters}{`p}
104 \DeclareMathSymbol{q}{\mathalpha}{letters}{`q}
105 \DeclareMathSymbol{r}{\mathalpha}{letters}{`r}
106 \DeclareMathSymbol{s}{\mathalpha}{letters}{`s}
107 \DeclareMathSymbol{t}{\mathalpha}{letters}{`t}
108 \DeclareMathSymbol{u}{\mathalpha}{letters}{`u}
109 \DeclareMathSymbol{v}{\mathalpha}{letters}{`v}
110 \DeclareMathSymbol{w}{\mathalpha}{letters}{`w}
111 \DeclareMathSymbol{x}{\mathalpha}{letters}{`x}
112 \DeclareMathSymbol{y}{\mathalpha}{letters}{`y}
113 \DeclareMathSymbol{z}{\mathalpha}{letters}{`z}

114 \DeclareMathSymbol{A}{\mathalpha}{letters}{`A}
115 \DeclareMathSymbol{B}{\mathalpha}{letters}{`B}
116 \DeclareMathSymbol{C}{\mathalpha}{letters}{`C}
117 \DeclareMathSymbol{D}{\mathalpha}{letters}{`D}
118 \DeclareMathSymbol{E}{\mathalpha}{letters}{`E}
119 \DeclareMathSymbol{F}{\mathalpha}{letters}{`F}
120 \DeclareMathSymbol{G}{\mathalpha}{letters}{`G}
121 \DeclareMathSymbol{H}{\mathalpha}{letters}{`H}
122 \DeclareMathSymbol{I}{\mathalpha}{letters}{`I}
123 \DeclareMathSymbol{J}{\mathalpha}{letters}{`J}
124 \DeclareMathSymbol{K}{\mathalpha}{letters}{`K}
125 \DeclareMathSymbol{L}{\mathalpha}{letters}{`L}
126 \DeclareMathSymbol{M}{\mathalpha}{letters}{`M}

```

```

127 \DeclareMathSymbol{N}{\mathalpha}{letters}{`N}
128 \DeclareMathSymbol{O}{\mathalpha}{letters}{`O}
129 \DeclareMathSymbol{P}{\mathalpha}{letters}{`P}
130 \DeclareMathSymbol{Q}{\mathalpha}{letters}{`Q}
131 \DeclareMathSymbol{R}{\mathalpha}{letters}{`R}
132 \DeclareMathSymbol{S}{\mathalpha}{letters}{`S}
133 \DeclareMathSymbol{T}{\mathalpha}{letters}{`T}
134 \DeclareMathSymbol{U}{\mathalpha}{letters}{`U}
135 \DeclareMathSymbol{V}{\mathalpha}{letters}{`V}
136 \DeclareMathSymbol{W}{\mathalpha}{letters}{`W}
137 \DeclareMathSymbol{X}{\mathalpha}{letters}{`X}
138 \DeclareMathSymbol{Y}{\mathalpha}{letters}{`Y}
139 \DeclareMathSymbol{Z}{\mathalpha}{letters}{`Z}

```

42.3.2 The digits

```

140 \DeclareMathSymbol{0}{\mathalpha}{operators}{`0}
141 \DeclareMathSymbol{1}{\mathalpha}{operators}{`1}
142 \DeclareMathSymbol{2}{\mathalpha}{operators}{`2}
143 \DeclareMathSymbol{3}{\mathalpha}{operators}{`3}
144 \DeclareMathSymbol{4}{\mathalpha}{operators}{`4}
145 \DeclareMathSymbol{5}{\mathalpha}{operators}{`5}
146 \DeclareMathSymbol{6}{\mathalpha}{operators}{`6}
147 \DeclareMathSymbol{7}{\mathalpha}{operators}{`7}
148 \DeclareMathSymbol{8}{\mathalpha}{operators}{`8}
149 \DeclareMathSymbol{9}{\mathalpha}{operators}{`9}

```

42.3.3 Punctuation, brace, etc. keys

```

150 \DeclareMathSymbol{!}{\mathclose}{operators}{`21}
151 \DeclareMathSymbol{*}{\mathbin}{symbols}{`03} % \ast
152 \DeclareMathSymbol{+}{\mathbin}{operators}{`2B}
153 \DeclareMathSymbol{,}{\mathpunct}{letters}{`3B}
154 \DeclareMathSymbol{-}{\mathbin}{symbols}{`00}
155 \DeclareMathSymbol{.}{\mathord}{letters}{`3A}
156 \DeclareMathSymbol{:}{\mathrel}{operators}{`3A}
157 \DeclareMathSymbol{;}{\mathpunct}{operators}{`3B}
158 \DeclareMathSymbol{=}{\mathrel}{operators}{`3D}
159 \DeclareMathSymbol{?}{\mathclose}{operators}{`3F}

```

The following symbols are defined as delimiters below which automatically defines them as math symbols.

```

160 \% \DeclareMathSymbol{()}{\mathopen}{operators}{`28}
161 \% \DeclareMathSymbol{}{\mathclose}{operators}{`29}
162 \% \DeclareMathSymbol{/}{\mathord}{letters}{`3D}
163 \% \DeclareMathSymbol{[]}{\mathopen}{operators}{`5B}
164 \% \DeclareMathSymbol{}{\mathclose}{operators}{`5D}
165 \% \DeclareMathSymbol{|}{\mathord}{symbols}{`6A}
166 \% \DeclareMathSymbol{<}{\mathrel}{letters}{`3C}
167 \% \DeclareMathSymbol{>}{\mathrel}{letters}{`3E}

```

Should all of the following being activated by default? Probably not.

```

168 \% \DeclareMathSymbol{"\{}{\mathopen}{symbols}{`66}
169 \% \DeclareMathSymbol{"\}}{\mathclose}{symbols}{`67}
170 \% \DeclareMathSymbol{"\\}{\mathord}{symbols}{`6E} % \backslash
171 \mathcode`\ = "8000 % \space
172 \mathcode`\ ='= "8000 % ^\prime

```

```
173 \mathcode`\_="8000 % \_
```

42.3.4 Delimitercodes for characters

[to be completed]

Finally, *InitEX* sets all `\delcode` values to -1, except `\delcode`.=0`

```
174 \DeclareMathDelimiter{()}{\mathopen}{operators}{28}{largesymbols}{00}
175 \DeclareMathDelimiter{}{\mathclose}{operators}{29}{largesymbols}{01}
176 \DeclareMathDelimiter{[]}{\mathopen}{operators}{5B}{largesymbols}{02}
177 \DeclareMathDelimiter{}{\mathclose}{operators}{5D}{largesymbols}{03}
```

The next two are considered to be relations when not used in the context of a delimiter! And worse, they do even represent different glyphs when being used as delimiter and not as delimiter. This is a user level syntax inherited from plain *T_EX*. Therefore we explicitly redefine the math symbol definitions for these symbols afterwards.

```
178 \DeclareMathDelimiter{<}{\mathopen}{symbols}{68}{largesymbols}{0A}
179 \DeclareMathDelimiter{>}{\mathclose}{symbols}{69}{largesymbols}{0B}
180 \DeclareMathSymbol{<}{\mathrel}{letters}{3C}
181 \DeclareMathSymbol{>}{\mathrel}{letters}{3E}
```

And here is another case where the non-delimiter version produces a glyph different from the delimiter version.

```
182 \DeclareMathDelimiter{/}{\mathord}{operators}{2F}{largesymbols}{0E}
183 \DeclareMathSymbol{/}{\mathord}{letters}{3D}
184 \DeclareMathDelimiter{|}{\mathord}{symbols}{6A}{largesymbols}{0C}
185 \expandafter\DeclareMathDelimiter@\backslashchar
186 \mathord{symbols}{6E}{largesymbols}{0F}
```

N.B. { and } should NOT get delcodes; otherwise parameter grouping fails!

42.4 Symbols accessed via control sequences

42.4.1 Greek letters

```
187 \DeclareMathSymbol{\alpha}{\mathord}{letters}{0B}
188 \DeclareMathSymbol{\beta}{\mathord}{letters}{0C}
189 \DeclareMathSymbol{\gamma}{\mathord}{letters}{0D}
190 \DeclareMathSymbol{\delta}{\mathord}{letters}{0E}
191 \DeclareMathSymbol{\epsilon}{\mathord}{letters}{0F}
192 \DeclareMathSymbol{\zeta}{\mathord}{letters}{10}
193 \DeclareMathSymbol{\eta}{\mathord}{letters}{11}
194 \DeclareMathSymbol{\theta}{\mathord}{letters}{12}
195 \DeclareMathSymbol{\iota}{\mathord}{letters}{13}
196 \DeclareMathSymbol{\kappa}{\mathord}{letters}{14}
197 \DeclareMathSymbol{\lambda}{\mathord}{letters}{15}
198 \DeclareMathSymbol{\mu}{\mathord}{letters}{16}
199 \DeclareMathSymbol{\nu}{\mathord}{letters}{17}
200 \DeclareMathSymbol{\xi}{\mathord}{letters}{18}
201 \DeclareMathSymbol{\pi}{\mathord}{letters}{19}
202 \DeclareMathSymbol{\rho}{\mathord}{letters}{1A}
203 \DeclareMathSymbol{\sigma}{\mathord}{letters}{1B}

Here cometh much profligate robustification of math constructs. Warning: some of these commands may become non-robust if an AMS package is loaded.

Further potential problems: some math font packages may make unfortunate assumptions about some of these definitions that are not true of the robust versions we need.

```

```

In contrast to `plain.tex` `\Relbar` got braces around the equal sign to guard against it being “math active” expanding to `\futurelet`.... This might be the case when packages are implementing shorthands for math, e.g. `=>` meaning `\Rightarrow` etc. It would actually be better not to use `=` in such definitions but instead define something like `\mathequalsign` and use this. However we can’t do this now as it would break other math layouts where characters are in different places (since those wouldn’t know about the need for a new command name).

```

\lgroup There are three plain TeX delimiters which are not fully supported by NFSS,
\rgroup since they partly point into a bold cmr font. Allocating a full symbol font, just
\bracevert to have three delimiters seems a bit too much given the limited space available.
For this reason only the extensible sizes are supported. If this is not desired one
can use, without losing portability, define \mathbf and \mathtt as font symbol
alphabet (setting up cmr/bx/n and cmtt/m/n as symbol fonts first) and modify
the delimiter declarations to point with their small variant to those symbol fonts.
(This is done in oldlfont.dtx so look there for examples.)
\lgroup % extensible ( with sharper tips

559 </cfgtext | cfgmath | cfgprel>
```

File u

preload.dtx

44 Overview

This file contains a number of possible settings for preloading fonts during installation of NFSS2 (which is used by L^AT_EX 2 _{ε}). It will be used to generate the following files:

preload.min	minimal subset of fonts necessary to run NFSS2
preload.ori	preload of CM fonts similar to the old <code>1fonts.tex</code>
preload.ltx	The standard selection of preloads
cmpreloa.xpt	preload of CM fonts for 10pt document size
cmpreloa.xip	preload of CM fonts for 11pt document size
cmpreloa.xii	preload of CM fonts for 12pt document size
dcpreloa.xpt	preload of DC fonts for 10pt size
dcpreloa.xip	preload of DC fonts for 11pt size
dcpreloa.xii	preload of DC fonts for 12pt size

These files are for installations that make use of Computer Modern fonts either old encoding (OT1) or Cork encoding (T1). The Computer Modern fonts with Cork encoding are known as DC-fonts.

Most important is `preload.ltx` which is used during format generation. You are *not* allowed to change this file.

45 Customization

You can customize the preloaded fonts in your L^AT_EX 2 _{ε} system by installing a file with the name `preload.cfg`. If this file exists it will be used in place of the system file `preload.ltx`. You can, for example, copy one of the files mentioned above (that can be generated from this source) to `preload.cfg`.

Or you can define completely other preloads. In that case start from `preload.min` since that contains the fonts that have to be preloaded by *all* L^AT_EX 2 _{ε} systems.

Avoid using `preload.ori`, it will load so many fonts that on most installations it is nearly impossible to load other font families afterwards. This file is only generated to show what fonts have been preloaded by L^AT_EX 2.09.

If you normally use other fonts than Computer Modern `preload.min` might be best.

Warning: If you preload fonts with encodings other than the normally supported encodings you have to declare that encoding in a `fontdef.cfg` configuration file (see the documentation in the file `fontdef.dtx`). Adding an extra encoding to the format might produce non-portable documents, thus this should be avoided if possible.

46 Module switches for the DOCSTRIP program

The DOCSTRIP will generate the above file from this source using the following module directives:

driver	produce a documentation driver file
preload	produce a preload...file
cm	for OT1 encoded Computer Modern
dc	for T1 encoded Computer Modern
min	produce minimal subset
xpt	produce 10pt preloads
xipt	produce 11pt preloads
xiipt	produce 12pt preloads
ori	produce preloads similar to old <code>lfonts.tex</code>
tex	produce <code>preload.ltx</code>

A typical DOCSTRIP command file would then have entries like:

```
\generateFile{preload.min}{t}{\from{preload.dtx}{preload,min}}
```

for generating preload files.

47 A driver for this document

The next bit of code contains the documentation driver file for `TEX`, i.e., the file that will produce the documentation you are currently reading. It will be extracted from this file by the DOCSTRIP program.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 %\OnlyDescription % comment out for implementation details
4 \begin{document}
5   \DocInput{preload.dtx}
6 \end{document}
7 
```

48 The code

We begin by loading the math extension font (`cmex10`) and the `LATEX` line and circle fonts. It is necessary to do this explicitly since these are used by `lplain.tex` and `latex.tex`. Since the internal font name contains / characters and digits we construct the name via `\csname`. These are the only fonts (!) that must be loaded in this file.

All `\DeclarePreloadSizes` can be removed or others can be added, they only influence the processing speed.

```
8 \expandafter\font\csname OMX/cmex/m/n/10\endcsname=cmex10\relax
9 \font\tenln =line10 \font\tenlnw =linew10\relax
10 \font\tencirc=lcircle10 \font\tencircw=lcirclew10\relax
```

The above fonts should not be touched but anything below this point here in the preload suggestions can be modified without any problems.

```
11 <-tex>%*****
```

```

File v **ltfntcmd.dtx**

Abstract

The commands defined in this file `ltfntcmd` are part of the kernel code for L^AT_EX 2_ε/NFSS2.

It is also meant to serve as documentation for package writers since it demonstrates how to define high-level font changing commands using a small number of creator functions.

49 Introduction

Font changes such as `\bfseries`, `\sffamily`, etc. are declarations; this means that their scope is delimited by the grouping structure, either by the next `\end` of some environment or by explicitly using a group, e.g., writing something like `{\bfseries...}` in the source. If you make the mistake of writing `\bfseries{...}` (thinking of `\bfseries` as a command with one argument) then the result is rather striking.

Font declarations are an artifact of the T_EX system and for several reasons it is better to avoid them on the user level whenever possible. In L^AT_EX3 they will probably all be replaced by environments and by font commands taking one argument.

This file defines a creator function for such declarative font switches. This function creates commands which can be used in both math and text.

This file also defines a number of high-level commands (all starting with `\text..`) that have one argument and typeset this argument in the requested way. Thus these commands are for typesetting short pieces of text in a specific family, series or shape. These are all produced as examples of the use of a creator function which is itself also defined in this file.

Table 1 shows all these high-level commands in action. A further advantage of using these commands is that they automatically take care of any necessary italic correction on either side of their argument.

Thus, when using such commands, one does not have to worry about forgetting the italic correction when changing fonts. Only in very few situations is this additional space wrong but, for example, most typographers recommend omitting the italic correction if a small punctuation character, like a comma, directly follows the font change. Since the amount of correction required is partly a matter of taste, you can define in what situations the italic correction should be suppressed. This is done by putting the characters that should cancel a preceding italic correction in the list `\nocorrlist`.⁷ The default definition for this list is produced by the following.

```
\newcommand \nocorrlist {,.}
```

⁷Any package that changes the `\catcode` of a character inside `\nocorrlist` must then explicitly reset the list. Otherwise the changed character will no longer be recognized by the suppression algorithm.

<i>Command</i>	<i>Corresponds to</i>	<i>Action</i>
<code>\textrm{...}</code>	<code>\rmfamily</code>	Typeset argument in roman family
<code>\textsf{...}</code>	<code>\sffamily</code>	Typeset argument in sans serif family
<code>\texttt{...}</code>	<code>\ttfamily</code>	Typeset argument in typewriter family
<code>\textmd{...}</code>	<code>\mdseries</code>	Typeset argument in medium series
<code>\textbf{...}</code>	<code>\bfseries</code>	Typeset argument in bold series
<code>\textup{...}</code>	<code>\upshape</code>	Typeset argument in normal shape
<code>\textit{...}</code>	<code>\itshape</code>	Typeset argument in <i>italic</i> shape
<code>\textsl{...}</code>	<code>\slshape</code>	Typeset argument in <i>slanted</i> shape
<code>\textsc{...}</code>	<code>\scshape</code>	Typeset argument in SMALL CAPS shape
<code>\emph{...}</code>	<code>\em</code>	Typeset argument <i>emphasized</i>

Table 1: Font-change commands with arguments

The font change commands provided here all start with `\text..` to emphasize that they are for use in normal text and to be easily memorable. They automatically take care of any necessary italic correction on either side of the argument.

It is best to declare the most often used characters first, because this will make the processing slightly faster. For example,

```
\emph{When using the \NFSS{} high-level commands,
the \emph{proper} use of italic corrections is
automatically taken care of}. Only
\emph{sometimes} one has to help \LaTeX{} by
adding a \verb=\nocorr= command.
```

which results in:

When using the NFSS high-level commands, the proper use of italic corrections is automatically taken care of. Only sometimes one has to help L^AT_EX by adding a \nocorr command.

In contrast, the use of the declaration forms is often more appropriate when you define your own commands or environments.

```
\newenvironment{bfitemize}{\begin{itemize}\normalfont\bfseries}
{\end{itemize}}
\begin{bfitemize}
\item This environment produces boldface items.
\item It is defined in terms of \LaTeX's
\texttt{itemize} environment and NFSS
declarations.
\end{bfitemize}
```

This gives:

- This environment produces boldface items.

- It is defined in terms of L^AT_EX's `itemize` environment and NFSS declarations.

In addition to global customization of when to insert the italic correction, it is of course sometimes necessary to explicitly insert one with `\!/`.

It is also possible to suppress the italic correction in individual instances. For this, the command `\nocorr` is provided.

The `\nocorr` must appear as the first or last token inside the braces of the argument of the `\text...` commands, at that end of the text where you wish to suppress the italic correction.

It is worth pointing out here that inserting a `\!/` in places where it can have no function (i.e. anywhere except immediately after a slanted letter) is not an error—it will just be silently ignored. Unfortunately this is not true if the redefinition of `\!/` in `amstex.sty` is used as this version can cause space to be removed immediately before the `\!/`.

50 The implementation

`\DeclareTextFontCommand` This is the creator function for `\text...` commands. It gives a warning if `\foo` or `\fragfoo` is already defined.

In math mode it simply puts the font declaration and text into a box (possibly an automatically sized one).

Otherwise it first scans the text to see where `\nocorr` occurs within it. This sets the `\check@ic` commands to do what is necessary concerning the italic correction at both ends.

The algorithm for deciding whether to put in an italic correction is not very subtle: one is added whenever the newly current font is not itself positively sloped, unless the next token is a character in the ‘nocorr’ list. At the end of the text this is done after closing the group so as to check the ‘outer font’. Note that this will often result in adding an italic correction token after a character in an unsloped font; we believe (in early 2003) that this is perhaps inefficient but not dangerous.

It also now checks for empty contents of the text command and optimises this case. Some care is also taken to check that doing dangerous things in vertical mode is avoided.

The italic correction token is added to the horizontal list before (in the list) an immediately preceding non-zero glob of glue (skip) and any non-zero penalty preceding that since, in the typical case, this puts it immediately after the last character in the preceding word.

Note that it is necessary to put in the `\aftergroup\maybe@ic` at the end of the group so that it comes after any other aftergroup tokens and immediately before the following tokens. It is also necessary to remove the `\fi` from the token list before the group ends; this is done by adding an `\expandafter` just before the closing brace.

```

1 (*2ekernel)
2 \def \DeclareTextFontCommand #1#2{%
3   \DeclareRobustCommand#1[1]{%
4     \ifmmode
5       \nfss@text{#2##1}%
6     \else
7       \hmode@bgroup

```

```

8      \text@command{##1}%
9      #2\check@icl ##1\check@icr
10     \expandafter
11     \egroup
12     \fi
13             }%
14 }

\textrm Now we define the \textfamily commands in terms of the above; \textttt does
\textsf not look very nice!
\texttt 15 \DeclareTextFontCommand{\textrm}{\rmfamily}
\textnormal 16 \DeclareTextFontCommand{\textsf}{\sffamily}
17 \DeclareTextFontCommand{\texttt}{\ttfamily}
18 \DeclareTextFontCommand{\textnormal}{\normalsize}

\textbf For the series attribute:
\textmd 19 \DeclareTextFontCommand{\textbf}{\bfseries}
20 \DeclareTextFontCommand{\textmd}{\mdseries}

\textit And for the shapes:
\textsl 21 \DeclareTextFontCommand{\textit}{\itshape}
\textsc 22 \DeclareTextFontCommand{\textsl}{\slshape}
\textup 23 \DeclareTextFontCommand{\textsc}{\scshape}
24 \DeclareTextFontCommand{\textup}{\upshape}

\emph Finally we have the \em font change declaration of LATEX. The corresponding
definition with argument is
25 \DeclareTextFontCommand{\emph}{\em}

\nocorr This is just a label, so it does nothing; it should also be unexpandable.
26 \let \nocorr \relax

\check@icl We define these defaults in case some error causes them to be expanded at the
\check@icr wrong time.
27 \let \check@icl \empty
28 \let \check@icr \empty

\text@command This checks for a \nocorr as the first token in its argument and also for one in
\check@nocorr@ any other position not protected within braces (the latter is treated as if it were
at the end of the argument).
Is this the correct action in the ‘empty’ case? It is efficient but typographically
it is, strictly, incorrect!
29 \def \text@command #1{%
30   \def \reserved@a {#1}%
31   \ifx \reserved@a \empty
32     \let \check@icl \empty
33     \let \check@icr \empty
34   \else
\space is a reserved word in LATEX or actually already in plain TEX. If somebody
really redefines it so many things will break that I don’t see any reason to make
this routine here slower than necessary.

```

```

35 %     \def \reserved@b { }%
36 %     \ifx \reserved@a \reserved@b

49 \def \reserved@b {#1}%
50 \def \reserved@c {#3}%
51 \ifx \reserved@a \reserved@b
52     \ifx \reserved@c \empty

```

In this case there is a `\nocorr` at the start but not at the end, so `\check@icl` should be empty.

```

53     \let \check@icl \empty
54 \else

```

Otherwise there is a `\nocorr` both at the start and elsewhere, so no italic corrections should be added.

```

55     \let \check@icl \empty
56     \let \check@icr \empty
57     \fi
58 \else
59     \ifx \reserved@c \empty

```

In this case there is no `\nocorr` anywhere, so we need to check for an italic correction at both the beginning and the end. This has been set up as the default so no code is needed here.

```

60 \else

```

In this case there is no `\nocorr` at the start but there is one elsewhere, so no `\aftergroup` is needed.

```

61     \let \check@icr \empty
62     \fi
63 \fi
64 }

```

`\maybe@ic` These macros implement the italic correction.

```

\maybe@ic@ 65 \def \maybe@ic {\futurelet\@let@token\maybe@ic@}
66 \def \maybe@ic@ {%

```

We first check to see if the current font is positively sloped. (But do not forget the message Rainer sent about an upright font with non-zero slope! Or is this an urban myth?) It has been suggested that this should test against a small positive value, but what?

```

67 \ifdim \fontdimen\onefont>z@
```

```
68 \else
69   \c@tempswatru
```

It would be possible, but probably not worthwhile, to continue the forward scan beyond any closing braces.

```
70 \expandafter\@tfor\expandafter\reserved@a\expandafter:\expandafter=%
71   \nocorrlist
```

We have to hide the `\@let@token` in the macro `\t@st@ic` rather than testing it directly in the loop since it might be `\let` to a `\fi` or `\else`, which would result in chaos.

```
72 \do \t@st@ic
```

Frank thinks that the next bit it is inefficient if done after the second change. Chris thinks that most all of this is inefficient for the commonest cases: but that is the price of a cleverer algorithm. It is certainly needed to deal with the use of `\nolinebreak`.

```
73 \if@ctempswa \sw@slant \fi
74 \fi
75 }
```

\t@st@ic The next token in the input stream is stored in `\@let@token` via a `\let`, the current token from `\nocorrlist` is stored via `\def` in `\reserved@a`. To compare them we have to fiddle around a bit.

If the only things to check were characters then this could be done via an `\if` thus their catcodes would not matter; but this will not work whilst `\futurelet` is used above.

```
76 \def \t@st@ic {%
77   \expandafter\let\expandafter\reserved@b\expandafter=\reserved@a\relax
78   \ifx\reserved@b\@let@token
```

If they are the same we record the fact and jump out of the loop.

```
79   \c@tempswafalse
80   \c@break@tfor
81 \fi
82 }
```

\sw@slant The definition of the mysterious `\sw@slant` command is as follows.

```
\fix@penalty 83 \def \sw@slant {%
```

It is surely correct to put in an italic correction when there is no skip. If the last thing on the list is actually a zero skip (including things whose dimension part is zero, such as `\hfill`), or anything other than a character, then the italic correction will have no effect.

In order to work correctly with unbreakable spaces from `\~` (and other common forms of line-breaking control) we also move back across a penalty before the glue.

```
84 \ifdim \lastskip=\z@
85   \fix@penalty
86 \else
87   \skip@ \lastskip
88   \unskip
89   \fix@penalty
90   \hskip \skip@
91 \fi
92 }
```

The above code means: “If there is a non-zero space just before the current position (`\ifdim...`) save the amount of that space (`\skip@\\lastskip`), remove it (`\unskip`), then do a similar thing if there is a penalty just before the skip, and finally put the space back in.”

Since zero glue cannot be distinguished in this context from no glue, we dare not put in an `\hskip` in this case as this may produce an unwanted breakpoint. This is not satisfactory.

The penalty before the glue is handled similarly, with the same caveats concerning the zero case. Is this the first recorded use of `\unpenalty` in standard L^AT_EX code?

```
93 \def \fix@penalty {%
94   \ifnum \lastpenalty=\z@
95     \@@italiccorr
96   \else
97     \count@ \lastpenalty
98     \unpenalty
99     \@@italiccorr
100    \penalty \count@
101  \fi
102 }
```

`\nocorrlist` This holds the list of characters that should prevent italic correction. They should be ordered by decreasing frequency of use. If any such character is made active later on one needs to redefine the list so that the active character becomes part of it.

```
103 \def \nocorrlist {..}
```

`\nfss@text` This command will by default behave like a L^AT_EX `\mbox` but may be redefined by packages such as `amstext.sty` to be a bit cleverer.

```
104 \ifx \nfss@text\undefined
105   \def \nfss@text {\leavevmode\hbox}
106 \fi
```

`\DeclareOldFontCommand` This is the function used to create declarative font-changing commands that can also be used to change alphabets in math-mode.

Usage: `\DeclareOldFontCommand \fn{\langle font-change decls\rangle} {\langle math-alphabet\rangle}`

Here `\fn` is the font-declaration command being defined, `\langle font-change decls\rangle` is the declaration it will expand to in text-mode, and `\langle math-alphabet\rangle` is the (single) math alphabet specifier which is to be used in math-mode.

It does not care whether the command being defined already exists but it does give a warning if it redefines anything.

Here are some typical examples of its use in conjunction with more basic NFSS2 font commands.

```
\DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}
\DeclareOldFontCommand{\sf}{\normalfont\sfamily}{\mathsf}
\DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}
```

```
107 \def \DeclareOldFontCommand #1#2#3{%
108   \ DeclareRobustCommand #1{\@fontswitch {#2}{#3}}%
109 }
```

\@fontswitch These two commands actually do the necessary tests and declarative font- or
\@@math@egroup alphabet-changing.

```
110 \def \@fontswitch #1#2{%
111   \ifmmode
112     \let \math@bgroup \relax
113     \def \math@egroup {\let \math@bgroup \@@math@bgroup
114                           \let \math@egroup \@@math@egroup}%
115 }
```

We need to have a `\relax` in the following line in case the `#2` is something like `\mathsf` grabbing the next token as an argument. For this reason the code also uses explicit arguments again (see pr/1275).

```
115   #2\relax
116 \else
117   #1%
118 \fi
119 }
120 \let \math@bgroup \math@bgroup
121 \let \math@egroup \math@egroup
```

These commands are available only in the preamble.

```
122 \onlypreamble \DeclareTextFontCommand
123 \onlypreamble \DeclareOldFontCommand
```

51 Initialization

\normalsize This is defined to produce an error.

```
124 \def\normalsize{%
125   \@latex@error {The font size command \protect\normalsize\space
126           is not defined:\MessageBreak
127           there is probably something wrong with
128           the class file}\@eha
129 }
130 </2ekernel>
```

File w

ltpageno.dtx

52 Page Numbering

Page numbers are produced by a page counter, used just like any other counter. The only difference is that `\c@page` contains the number of the next page to be output (the one currently being produced), rather than one minus it. Thus, it is normally initialized to 1 rather than 0. `\c@page` is defined to be `\count0`, rather than a count assigned by `\newcount`.

`\pagenumbering`

The user sets the pagenumber style with the `\pagenumbering{<foo>}` command, which sets the page counter to 1 and defines `\thepage` to be `\foo`. For example, `\pagenumbering{roman}` causes pages to be numbered i, ii, etc.

```
1 {*2ekernel}
2 \message{page nos.,}
3 \countdef\c@page=0 \c@page=1
4 \def\cl@page{}
5 \def\pagenumbering#1{%
6   \global\c@page \c@ne \gdef\thepage{\csname @#1\endcsname
7   \c@page}}
8 /2ekernel}
```

File x

ltxref.dtx

53 Cross Referencing

The user writes `\label{<foo>}` to define the following cross-references:

`\ref{<foo>}`: value of most recently incremented referencable counter. in the current environment. (Chapter, section, theorem and enumeration counters counters are referencable, footnote counters are not.)

`\pageref{<foo>}`: page number at which `\label{foo}` command appeared. where foo can be any string of characters not containing ‘\’, ‘{’ or ‘}’.

Note: The scope of the `\label` command is delimited by environments, so
`\begin{theorem} \label{foo} ... \end{theorem} \label{bar}`
defines `\ref{foo}` to be the theorem number and `\ref{bar}` to be the current section number.

Note: `\label` does the right thing in terms of spacing – i.e., leaving a space on both sides of it is equivalent to leaving a space on either side.

53.1 Cross Referencing

```
1 {*2ekernel}
2 \message{x-ref,}
```

This is implemented as follows. A referencable counter CNT is incremented by the command `\refstepcounter{CNT}`, which sets `\@currentlabel == {CNT}\eval(\p@cnt\theCNT)`. The command `\label{FOO}` then writes the following on file `\@auxout`:

```
\newlabel{FOO}{\eval(\@currentlabel)\eval(\thepage)}
```

```
\ref{FOO} ==
BEGIN
  if \r@foo undefined
    then  @refundefined := G T
    ??
    Warning: 'reference foo on page ... undefined'
  else  \@car \eval(\r@FOO)\@nil
fi
END

\pageref{foo} =
BEGIN
  if \r@foo undefined
    then  @refundefined := G T
    ??
    Warning: 'reference foo on page ... undefined'
  else  \@cdr \eval(\r@FOO)\@nil
fi
END
```

\G@refundefinedtrue
\@refundefined This does not save on name-space (since \G@refundefinedfalse was never needed) but it does make the implementation of such one-way switches more consistent. The extra macro to make the change is used since this change appears several times.

Note despite its name, \G@refundefinedtrue does *not* correspond to an \if command, and there is no matching ...false. It would be more natural to call the command \G@refundefined (as inspection of the change log will reveal) but unfortunately such a change would break any package that had defined a \ref-like command that mimicked the definition of \ref, calling \G@refundefinedtrue. Inspection of the T_EX archives revealed several such packages, and so this command has been named ...true so that the definition of \ref need not be changed, and the packages will work without change.

```
3 % \newif\ifG@refundefined
4 % \def\G@refundefinedtrue{\global\let\ifG@refundefined\iftrue}
5 % \def\G@refundefinedfalse{\global\let\ifG@refundefined\iffalse}
6 \def\G@refundefinedtrue{%
7   \gdef\@refundefined{%
8     \@latex@warning@no@line{There were undefined references}}}
9 \let\@refundefined\relax
```

\ref Referencing a \label. RmS 91/10/25: added a few extra \reset@font, as suggested by Bernd Raichle
\pageref RmS 92/08/14: made \ref and \pageref robust
\@setref RmS 93/09/08: Added setting of refundefined switch.

```
10 \def\@setref#1#2#3{%
11   \ifx#1\relax
12   \protect\G@refundefinedtrue
13   \nfss@text{\reset@font\bfseries ??}%
14   \@latex@warning{Reference '#3' on page \thepage \space
15   undefined}%
16   \else
17   \expandafter#2#1\null
18   \fi}

38   \protected@edef\currentlabel{%
39     \csname p@#1\endcsname\csname the#1\endcsname}%
40 }
41 
```

\@currentlabel For \label commands that come before any environment

```

42 \def\@currentlabel{}

43 
```

53.2 An extension of counter referencing

At the moment a reference to a counter `foo` will generate the equivalent of `\p@foo\thefoo` although not quite in this form. For some applications it would be nice if one could have `\thefoo` being an argument to `\p@foo` to be able to put material before and after the number generated by `\thefoo`. This can be easily achieved with a small change to one of the kernel commands as follows:

```

\def\refstepcounter#1{\stepcounter{#1}%
  \protected@edef\currentlabel{%
    \csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
}

```

The trick is to ensure that `\csname the#1\endcsname` is turned into a single token before `\p@...` is expanded further. This way, if the `\p@...` command is a macro with one argument it will receive `\the....`. With the kernel code (i.e., without the `\expandafter`) it will instead pick up `\csname` which would be disastrous.

Using `\expandafter` instead of braces delimiting the argument is better because, assuming that the `\p@...` command is not defined as a macro with one argument, the braces will stay and prohibit kerning that might otherwise happen between the glyphs generated by `\the...` and surrounding glyphs.

We have refrained from making this change in the kernel code although for existing documents it would be 100% backward compatible. The reason being

that any class or package making use of this functionality would then horribly fail with older L^AT_EX installations.

Instead we suggest that people who are interested in using this functionality in a document class or package add the redefinition to the class file. To ensure that this redefinition is properly applied they might want to test for the original definition first, e.g.

```
\CheckCommand*\refstepcounter[1]{\stepcounter{#1}%
  \protected@edef@\currentlabel
    {\csname p@#1\endcsname\csname the#1\endcsname}%
}
\renewcommand*\refstepcounter[1]{\stepcounter{#1}%
  \protected@edef@\currentlabel
    {\csname p@#1\expandafter\endcsname\csname the#1\endcsname}%
}
```

ltmiscen.dtx

54 Miscellaneous Environments

This section implements the basic environment mechanism, and also a few specific environments including `document`, The math environments and related commands, the ‘flushing’ environments, (`center`, `flushleft`, `flushright`), and `verbatim`.

```
1 <*2ekernel>
2 \message{environments,}
```

54.1 Environments

`\begin{foo}` and `\end{foo}` are used to delimit environment `foo`.

`\begin{foo}` starts a group and calls `\foo` if it is defined, otherwise it does nothing.

`\end{foo}` checks to see that it matches the corresponding `\begin` and if so, it calls `\endfoo` and does an `\endgroup`. Otherwise, `\end{foo}` does nothing.

If `\end{foo}` needs to ignore blanks after it, then `\endfoo` should globally set the `@ignore` switch true with `\@ignoretrue` (this will automatically be global).

NOTE: `\@end` is defined to be the `\end` command of T_EX82.

`\enddocument` is the user’s command for ending the manuscript file.

`\stop` is a panic button — to end T_EX in the middle.

```

27  \refundefined

```

If a label is defined more than once, `\tempswa` will always be true and thus produce a “Label(s) may ...” warning. But since a rerun will not solve that problem (unless one uses a package like `varioref` that generates labels on the fly), we suppress this message.

```

\@currenvline We do need a default value for \@currenvline on top-level since the document environment cancels the brace group. This means that a mismatch with \begin{document} will not produce a line number. Thus the outer default must be \empty or we will end up with two spaces.
66 \let\@currenvline\empty

```

54.2 Center, Flushright, Flushleft

```

67 \message{center,}

\center, \flushright and \flushleft set
  \rightskip = 0pt or \flushglue (as appropriate)
  \leftskip = 0pt or \flushglue (as appropriate)
  \parindent = 0pt
  \parfillskip = 0pt. (except \flushleft)
  \\ == \par \vskip -\parskip
  \\[LENGTH] == \\ \vskip LENGTH
  \\* == \par \penalty 10000 \vskip -\parskip
  \\*[LEN] == \\* \vskip LENGTH
```

They invoke the trivlist environment to handle vertical spacing before and after them.

\centering, \raggedright and \raggedleft are the declaration analogs of the above.

\raggedright has a more universal effect, however. It sets \rightskip := flushglue. Every environment, like the list environments, that set \rightskip to its 'normal' value set it to \rightskip

```

54.3 Verbatim

The verbatim environment uses the fixed-width `\ttfamily` font, turns blanks into spaces, starts a new line for each carriage return (or sequence of consecutive carriage returns), and interprets *every* character literally. I.e., all special characters `\`, `{`, `$`, etc. are `\catcode`'d to 'other'.

The command `\verb` produces in-line verbatim text, where the argument is delimited by any pair of characters. E.g., `\verb #...#` takes '`...`' as its argument, and sets it verbatim in `\ttfamily` font.

The `*-variants` of these commands are the same, except that spaces print as the TeXbook's space character instead of as blank spaces.

ltmath.dtx

55 Math setup

This file contains a lot of the original plain T_EX code, as well as the L^AT_EX environments for math. It still needs sorting out.

```
1 <*2ekernel>
2 \message{math definitions,}
```

55.1 Math commands based on plain T_EX

55.1.1 The log-like functions

\log The standard operators:

```
3 \def\log{\mathop{\operator@font log}\nolimits}
4 \def\lg{\mathop{\operator@font lg}\nolimits}
5 \def\ln{\mathop{\operator@font ln}\nolimits}
6 \def\lim{\mathop{\operator@font lim}\nolimits}
7 \def\limsup{\mathop{\operator@font lim\,,sup}\nolimits}
8 \def\liminf{\mathop{\operator@font lim\,,inf}\nolimits}
9 \def\sin{\mathop{\operator@font sin}\nolimits}
10 \def\arcsin{\mathop{\operator@font arcsin}\nolimits}
11 \def\sinh{\mathop{\operator@font sinh}\nolimits}
12 \def\cos{\mathop{\operator@font cos}\nolimits}
13 \def\arccos{\mathop{\operator@font arccos}\nolimits}
14 \def\cosh{\mathop{\operator@font cosh}\nolimits}
15 \def\tan{\mathop{\operator@font tan}\nolimits}
16 \def\arctan{\mathop{\operator@font arctan}\nolimits}
17 \def\tanh{\mathop{\operator@font tanh}\nolimits}
18 \def\cot{\mathop{\operator@font cot}\nolimits}
19 \def\coth{\mathop{\operator@font coth}\nolimits}
20 \def\sec{\mathop{\operator@font sec}\nolimits}
21 \def\csc{\mathop{\operator@font csc}\nolimits}
22 \def\max{\mathop{\operator@font max}\nolimits}
23 \def\min{\mathop{\operator@font min}\nolimits}
24 \def\sup{\mathop{\operator@font sup}\nolimits}
25 \def\inf{\mathop{\operator@font inf}\nolimits}
26 \def\arg{\mathop{\operator@font arg}\nolimits}
27 \def\ker{\mathop{\operator@font ker}\nolimits}
28 \def\dim{\mathop{\operator@font dim}\nolimits}
29 \def\hom{\mathop{\operator@font hom}\nolimits}
30 \def\det{\mathop{\operator@font det}\nolimits}
31 \def\exp{\mathop{\operator@font exp}\nolimits}
32 \def\Pr{\mathop{\operator@font Pr}\nolimits}
33 \def\gcd{\mathop{\operator@font gcd}\nolimits}
34 \def\deg{\mathop{\operator@font deg}\nolimits}
```

\bmod And some operators have to be done by hand:

```
35 \def\bmod{%
36   \nonscript\mskip-\medmuskip\mkern5mu%
```

```

37 \mathbin{\operator@font mod}\penalty900\mkern5mu%
38 \nonscript\mskip-\medmuskip}

\pmod
39 \def\pmod#1{%
40   \allowbreak\mkern18mu(\{\operator@font mod\},\,,#1)}

```

55.1.2 Biggggg

\big Variants on \big and friends for use with delimiters:

```

41 \def\bigr{\mathopen\bigr}
42 \def\bigrm{\mathrel\bigr}
43 \def\bigr{\mathclose\bigr}
44 \def\Bigl{\mathopen\Bigl}
45 \def\Bigr{\mathrel\Bigl}
46 \def\Bigr{\mathclose\Bigl}
47 \def\biggl{\mathopen\biggl}
48 \def\biggm{\mathrel\biggl}
49 \def\biggr{\mathclose\biggl}
50 \def\Biggl{\mathopen\Biggl}
51 \def\Biggm{\mathrel\Biggl}
52 \def\Biggr{\mathclose\Biggl}

```

55.1.3 The UNSORTED Rest

The other math commands are lifted from plain T_EX.

198 \def\equation{$$\refstepcounter{equation}}
199 \def\endequation{\eqno \hbox{\c@eqnnum}$$\ignoretrue}

\c@eqnnum Produces the equation number for equation and eqnarray environments. The
following definition is for flushright numbers; for flushleft numbers, see leqno.clo.
The equation number is set in black roman type even if an eqnarray environment
appears in an italic environment.
200 \def\c@eqnnum{{\normalfont \normalcolor (\theequation)}}

55.3 External options to the standard document classes

55.3.1 Left equation numbering

- \@eqnnum To put the equation number on the left side of an equation we have to use a little trick. The number is shifted \displaywidth to the left inside a box of (approximately) zero width. This fails when the quation is too wide, the equation number than may overprint the equation itself.

```
268 <*leqno>
269 \renewcommand\@eqnnum{\hb@xt@.01\p@{}%
270           \rlap{\normalfont\normalcolor
271           \hskip -\displaywidth(\theequation)}}
272 </leqno>
```

55.3.2 Flush left equations

To get the displayed math environments to print the contents flush left (with an indentation) we have to redefine all of L^AT_EX 2_ε's displayed math environments.

- \mathindent The amount of indentation of the equations is stored in a register.

```
273 <*fleqn>
274 \newdimen\mathindent
```

The setting of \mathindent has to be deferred until the class file has been processed, because \leftmargini is still 0pt wide at the moment *fleqn.clo* is read in.

```
275 \AtEndOfClass{\mathindent\leftmargini}
```

\[Begin display math;

56 List, and related environments

The generic commands for creating an indented environment – `enumerate`, `itemize`, `quote`, etc – are:

```
\list{\LABEL}{{COMMANDS}} ... \endlist
```

which can be invoked by the user as the list environment. The *LABEL* argument specifies item labeling. *COMMANDS* contains commands for changing the horizontal and vertical spacing parameters.

Each item of the environment is begun by the command `\item[ITEMLABEL]` which produces an item labeled by *ITEMLABEL*. If the argument is missing, then the *LABEL* argument of the `\list` command is used as the item label.

The label is formed by putting `\makelabel{\ITEMLABEL}` in an hbox whose width is either its natural width or else `\labelwidth`, whichever is larger. The `\list` command defines `\makelabel` to have the default definition:

```
\makelabel{\ARG} == BEGIN \hfil ARG END
```

which, for a label of width less than `\labelwidth`, puts the label flushright, `\labelsep` to the left of the item's text. However, `\makelabel` can be `\let` to another command by the `\list`'s *COMMANDS* argument.

A `\usecounter{\foo}` command in the second argument causes the counter *foo* to be initialized to zero, and stepped by every `\item` command without an argument. (`\label` commands within the list refer to this counter.)

When you leave a list environment, returning either to an enclosing list or normal text mode, LaTeX begins a new paragraph if and only if you leave a blank line after the `\end` command. This is accomplished by the `\@endparenv` command.

Blank lines are ignored every other reasonable place—i.e.:

- Between the `\begin{list}` and the first `\item`,
- Between the `\item` and the text of that item.
- Between the end of the last item and the `\end{list}`.

For an environment like quotation, in which items are not labeled, the entire environment is a single item. It is defined by letting `\quotation == \list{}{\...}\item\relax`. (Note the `\relax`, there in case the first character in the environment is a '['.) The spacing parameters provide a great deal of flexibility in designing the format, including the ability to let the indentation of the first paragraph be different from that of the subsequent ones.

The trivlist environment is equivalent to a list environment whose second argument sets the following parameter values:

`\leftmargin = 0`: causes no indentation of left margin

`\labelwidth = 0`: see below for precise effect this has.

`\itemindent = 0`: with a null label, makes first paragraph have no indentation. Succeeding paragraphs have `\parindent` indentation. To give first paragraph same indentation, set `\itemindent = \parindent` before the `\item[]`.

Every `\item` in a trivlist environment must have an argument—in many cases, this will be the null argument (`\item[]`). The trivlist environment is mainly used for paragraphing environments, like verbatim, in which there is no margin change. It provides the same vertical spacing as the list environment, and works reasonably well when it occurs immediately after an `\item` command in an enclosing list.

56.1 List and Trivlist

The following variables are used inside a list environment:

`\@totalleftmargin` The distance that the prevailing left margin is indented from the outermost left margin,

`\linewidth` The width of the current line. Must be initialized to `\hsize`.

`\@listdepth` A count for holding current list nesting depth.

`\makelabel` A macro with a single argument, used to generate the label from the argument (given or implied) of the `\item` command. Initialized to `\@mklab` by the `\list` command. This command must produce some stretch—i.e., an `\hfil`.

`\@inlabel` A switch that is false except between the time an `\item` is encountered and the time that T_EX actually enters horizontal mode. Should be tested by commands that can be messed up by the list environment's use of `\everypar`.

`\boxlabels` When `\@inlabel = true`, it holds the labels to be put out by `\everypar`.

`\@noperitem` A switch set by `\list` when `\@inlabel = true`. Handles the case of a `\list` being the first thing in an item.

`\@noperlist` A switch set true for a list that begins an item. No `\topsep` space is added before or after `\item`'s such a list.

`\@newlist` Set true by `\list`, set false by the first text (by `\everypar`).

`\@noitemarg` Set true when executing an `\item` with no explicit argument. Used to save space. To save time, make two separate `\@item` commands.

`\@nmbrlist` Set true by `\usecounter` command, causes list to be numbered.

`\@listctr` \def'ed by `\usecounter` to name of counter.

`\@noskipsec` A switch set true by a sectioning command when it is creating an in-text heading with `\everypar`.

Throughout a list environment, `\hsize` is the width of the current line, measured from the outermost left margin to the outermost right margin. Environments like tabbing should use `\linewidth` instead of `\hsize`.

Here are the parameters of a list that can be set by commands in the `\list`'s COMMANDS argument. These parameters are all TeX skips or dimensions (defined by `\newskip` or `\newdimen`), so the usual TeX or L^AT_EX commands can be used to set them. The commands will be executed in vmode if and only if the `\list` was preceded by a `\par` (or something like an `\end{list}`), so the spacing parameters can be set according to whether the list is inside a paragraph or is its own paragraph.

56.2 Vertical Spacing (skips)

`\topsep`: Space between first item and preceding paragraph.

`\partopsep`: Extra space added to `\topsep` when environment starts a new paragraph (is called in vmode).

`\itemsep`: Space between successive items.

`\parsep`: Space between paragraphs within an item – the `\parskip` for this environment.

56.3 Penalties

`\@beginparpenalty`: put at the beginning of a list

`\@endparpenalty`: put at end of list

`\@itempenalty`: put between items.

56.4 Horizontal Spacing (dimens)

`\leftmargin`: space between left margin of enclosing environment (or of page if top level list) and left margin of this list. Must be nonnegative.

`\rightmargin`: analogous.

`\listparindent`: extra indentation at beginning of every paragraph of a list except the one started by the `\item` command. May be negative! Usually, labeled lists have `\listparindent` equal to zero.

`\itemindent`: extra indentation added right BEFORE an item label.

`\labelwidth`: nominal width of box that contains the label. If the natural width of the label $\leq \labelwidth$, then the label is flushed right inside a box of width `\labelwidth` (with an `\hfil`). Otherwise, a box of the natural width is employed, which causes an indentation of the text on that line.

`\labelsep`: space between end of label box and text of first item.

56.5 Default Values

Defaults for the list environment are set as follows. First, `\rightmargin`, `\listparindent` and `\itemindent` are set to 0pt. Then, one of the commands `\@listi`, `\@listii`, ..., `\@listvi` is called, depending upon the current level of the list. The `\@list ...` commands should be defined by the document style. A convention that the document style should follow is to set `\leftmargin` to `\leftmargini`, ..., `\leftmarginvi` for the appropriate level. Items that aren't changed may be left alone, but everything that could possibly be changed must be reset.

\par@deathcycles
56 \newcount\par@deathcycles

\@trivlist Because \par is sometimes made a no-op it is possible for a missing \item to
produce a loop that does not fill memory and so never gets trapped by TeX.
We thus need to trap this here by setting \par to count the number of times a
paragraph is called with no progress being made started.

\@endparenv To suppress the paragraph indentation in text immediately following a paragraph-making environment, \everypar is changed to remove the space, and \par is redefined to restore \everypar. Instead of redefining \par and \everpar, \@endparenv was changed to set the @endpe switch, letting \end redefine \par and \everypar.

This allows paragraph-making environments to work right when called by other environments. (Changed 27 Oct 86)

```

173     \if@inlabel
174         \global\@inlabelfalse

```

The paragraph indent is now removed by using `\setbox...` since this makes `\noindent` a no-op here, as it should be. Thus the following comment is redundant but is left here for the sake of future historians: this next command was changed from an `hskip` to a `kern` to avoid a break point after the parindent box: the skip could cause a line-break if a very long label occurs in `raggedright` setting.

If `\noindent` was used after `\item` want to cancel the `\itemindent` skip. This case can be detected as the indentation box will be void.

```

175     {\setbox\z@\lastbox
176     \ifvoid\z@
177         \kern-\itemindent
178     \fi}%

181 \fi

```

This code is intended to prevent a page break after the first line of an item that comes immediately after a section title. It may be sensible to always forbid a page break after one line of an item? As with all such settings of `\clubpenalty` it is local so will have no effect if the item starts in a group.

Only resetting `\@nobreak` when it is true is now essential since now it is sometimes set locally.

```

182     \if@nobreak
183         \nobreakfalse
184         \clubpenalty \OM

56.6 Itemize and Enumerate

Enumeration is done with four counters: `enumi`, `enumii`, `enumiii` and `enumiv`, where `enumN` controls the numbering of the Nth level enumeration. The label is generated by the commands `\labelenumi` ... `\labelenumiv`, which should be defined by the document style. Note that `\p@enumN\theenumN` defines the output of a `\ref` command. A typical definition might be:

```

\def\theenumii{\alph{enumii}}
\def\p@enumii{\theenumii}
\def\labelenumii{(\theenumii)}

```

which will print the labels as ‘(a)’, ‘(b)’, ... and print a `\ref` as ‘3a’.

The item numbers are moved to the right of the label box, so they are always a distance of `\labelsep` from the item.

```

\@enumdepth holds the current enumeration nesting depth.
Itemization is controlled by four commands: \labelitemi, \labelitemii,
\labelitemiii, and \labelitemiv. To cause the second-level list to be bulleted,
you just define \labelitemii to be •. \@itemspacing and \@itemdepth are the
analogs of \@enumspacing and \@enumdepth.

ltboxes.dtx

57 L^AT_EX Box commands

- \makebox \makebox[⟨wid⟩][⟨pos⟩]{⟨obj⟩}
Puts ⟨obj⟩ in an \hbox of width ⟨wid⟩, positioned by ⟨pos⟩.
The possible ⟨pos⟩ are:
s stretched,
l flushleft,
r flushright,
c (default) centred.
If ⟨wid⟩ is missing, then ⟨pos⟩ is also missing and ⟨obj⟩ is put in an \hbox of its natural width.
- \makebox⟨x⟩⟨y⟩[⟨pos⟩]{⟨obj⟩}
Puts ⟨obj⟩ in an \hbox of width $x * \unitlength$ and height $y * \unitlength$. ⟨pos⟩ arguments are **s**, **l**, **r** or **c** (default) for stretched, flushleft, flushright or centred, and **t** or **b** for top, bottom – or combinations like **tr** or **rb**. Default for horizontal and vertical are centered. Note that in this picture mode version of \makebox a [b] aligns on the *bottom* of the text as documented. If you want to align on the *baseline* use \makebox(,)[b]{\raisebox{0pt}[\height]{0pt}{xyz}} or \makebox(,)[b]{\smash{xyz}}
- \mbox \mbox{⟨obj⟩} The same as \makebox{⟨obj⟩}, but is more efficient as no checking for optional arguments is done.
- \newsavebox \newsavebox{⟨cmd⟩} : If ⟨cmd⟩ is undefined, then defines it to be a T_EX box register.
- \savebox \savebox{⟨cmd⟩} ... : ⟨cmd⟩ is defined to be a T_EX box register, and the '...' are any \makebox arguments. It is like \makebox, except it doesn't produce text but saves the value in \box ⟨cmd⟩.
- \sbox \sbox{⟨cmd⟩}{⟨obj⟩} is an efficient abbreviation for \savebox{⟨cmd⟩}{⟨obj⟩}.
- \lrbox \begin{lrbox}{⟨cmd⟩}{⟨text⟩}\end{lrbox} is equivalent to \sbox{⟨cmd⟩}{⟨text⟩} except that any white space at the beginning and end of ⟨text⟩ is ignored.
- \framebox ... : like \makebox, except it puts a 'frame' around the box. The frame is made of lines of thickness \fboxrule, separated by space \fboxsep from the text – except for \framebox(X,Y) ... , where the thickness of the lines is as for the picture environment, and there is no separation added.
- \fbox \fbox{⟨obj⟩} is an abbreviation for \framebox{⟨obj⟩}.
- \parbox[⟨pos⟩][⟨height⟩][⟨inner-pos⟩]{⟨width⟩}{⟨text⟩} : Makes a box with \hsize ⟨width⟩, positioned by ⟨pos⟩ as follows: c : \vcenter (placed in \$...\$ if not in math mode) b : \vbox t : \vtop default value is c. Sets \hsize := ⟨width⟩ and calls \parboxrestore, which does the following: Restores the original definitions of:

```

\par
\\
\-
\'
\
\=
Resets the following parameters:
\parindent      = 0pt
\parskip       = 0pt
\linewidth     = \hsize
\@totalleftmargin = 0pt
\leftskip      = 0pt
\rightskip     = 0pt
\@rightskip    = 0pt
\parfillskip   = 0pt plus 1fil
\lineskip      = \normallineskip
\baselineskip  = \normalbaselineskip
Calls \sloppy
Note: \carrayparboxrestore same as \parboxrestore but it doesn't restore \\.

minipage minipage : Similar to \parbox, except it also makes this look like a page by setting
\textwidth == \columnwidth == box width
changes footnotes by redefining:
\@mpfn == mpfootnote
\thempfn == \thempfootnote
\@footnotetext == \@mpfootnotetext
resets the following list environment parameters:
\@listdepth == \mplistdepth
where \mplistdepth is initialized to zero,
and executes \minipagerestore to allow the document style to reset any other parameters it desires. It sets @minipage true, and resets \everypar to set it false. This switch keeps \addvspace from putting space at the top of a minipage.
Change added 24 May 89: \minipage sets @minipage globally; \endminipage resets it false.

\rule \rule[<raised>]{<width>}{<height>} : Makes a <width> * <height> rule, raised <raised>.
\underline \underline{<text>} : Makes an underlined hbox with <text> in it.
\raisebox \raisebox{<distance>}[<height>][<depth>]{<box>} :
Raises <box> up by <distance> length (down if <distance> negative). Makes TeX think that the new box extends <height> above the line and <depth> below, for a total vertical length of <height>+<depth>. Default values of <height> & <depth> = actual height and depth of box in new position.

```
\@arrayparboxrestore Restore various paragraph parameters.
```

The rational for allowing two normally global flags to be set locally here was stated originally by Donald Arsenu and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within boxes or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in `\set@nobreak`; otherwise this command will be redundant.

```

\@finalstrut This macro adds a special strut the *depth* of the box given as #1, and height and width 0pt. It is used for ensuring that the last line of a paragraph has the correct depth in ‘p’ columns of tables and in footnotes. In vertical mode nothing is done, as adding the strut (as done in 2.09) would start a new paragraph. It

would be possible to inspect `\prevdepth` to check the depth of the just-completed paragraph, but we do not do that here. Actually we do even less now, skip the vmode test as it broke tabular ‘p’ columns. .

The `\nobreak` was added (1995/10/31) to allow hyphenation of the final word of the paragraph.

```
287 \def\@finalstrut#1{%
288   \unskip\ifhmode\nobreak\fi\vrule\@width\z@\@height\z@\@depth\dp#1}
```

57.1 Some low-level constructs

The following commands are basically inherited from plain TeX.

`\leftline` These macros place text on a full line either centred or left or right adjusted.
`\rightline` 289 `\def\@cline{\hb@xt@{\hsize}{}`
`\centerline` 290 `\def\leftline#1{\@cline{\#1\hss}}`
 `\@cline` 291 `\def\rightline#1{\@cline{\hss#1}}`
 `\def\centerline#1{\@cline{\hss#1\hss}}`

`\rlap` These macros place text to the left or right of the current reference point without
`\llap` taking up space.
293 `\def\rlap#1{\hb@xt@{\z@}{#1\hss}}`
294 `\def\llap#1{\hb@xt@{\z@}{\hss#1}}`
295 `</2ekernel>`

File C

ltxtab.dtx

58 Tabbing, Tabular and Array Environments

This section deals with ‘Lining It Up in Columns’. First the `tabbing` environment is defined, and then in second part, `tabular` together with its variants, `tabular*` and `array`.

Note that the `tabular` defined here is essentially the original L^AT_EX 2.09 version, not the extended version described in *The L^AT_EX Companion*. Use the `array` package to obtain the extended version.

58.1 tabbing

`\dimen(\@firsttab + i)` = distance of tab stop *i* from left margin
 $0 \leq i \leq 15$ (?).

`\dimen\@firsttab` is initialized to `\@totalleftmargin`, so it starts at the prevailing left margin.

`\@maxtab` = number of highest defined tab register
probably = `\@firsttab + 12`

`\@nxttabmar` = tab stop number of next line’s left margin

`\@curtabmar` = tab stop number of current line’s left margin
`\@curtab` = number of the current tab. At start of line,

it equals `\@curtabmar`

`\@heightab` = largest tab number currently defined.

`\@tabpush` = depth of `\pushtab`’s

`\box\@curline` = contents of current line, excluding left margin
skip, and excluding contents of current field

`\box\@curfield` = contents of current field

`@rjfield` = switch: T iff the last field of the line should
be right-justified at the right margin.

`\tabbingsep` = distance left by the `\`` command between the
current position and the field that is
“left-shifted”.

UTILITY MACROS

`\@stopfield` : closes the current field

`\@addfield` : adds the current field to the current line.

`\@contfield` : continues the current field

`\@startfield` : begins the next field

`\@stopline` : closes the current line and outputs it

`\@startline` : starts the next line

`\@ifatmargin` : an `\if` that is true iff the current line.

58.2 array and tabular environments

ARRAY PARAMETERS:

```

\arraycolsep
  : half the width separating columns in an array environment
\tabcolsep
  : half the width separating columns in a tabular environment
\arrayrulewidth
  : width of rules
\doublerulesep
  : space between adjacent rules in array or tabular
\arraystretch
  : line spacing in array and tabular environments is done by
    placing a strut in every row of height and depth
    \arraystretch times the height and depth of the strut
    produced by an ordinary \strut command.

```

PREAMBLE:

The PREAMBLE argument of an array or tabular environment can contain the following:

l,r,c : indicate where entry is to be placed.
| : for vertical rule
@{EXP} : inserts the text EXP in every column.
 \arraycolsep or \tabcolsep spacing is suppressed.
*{N}{PRE} : equivalent to writing N copies of PRE in the preamble.
 PRE may contain *{N'}{EXP'} expressions.
p{LEN} : makes entry in parbox of width LEN.

SPECIAL ARRAY COMMANDS:

\multicolumn{N}{FORMAT}{ITEM} : replaces the next N column items by ITEM, formatted according to FORMAT.
FORMAT should contain at most one l,r or c.
If it contains none, then ITEM is ignored.

\vline : draws a vertical line the height of the current row. May appear in an array element entry.

\hline : draws a horizontal line between rows. Must appear either before the first entry (to appear above the first row) or right after a \\ command. If followed by another \hline, then adds a \vskip of \doublerulesep.

\cline[i-j] : draws horizontal lines between rows covering columns i through j, inclusive. Multiple commands may follow one another to provide lines covering several disjoint columns

\extracolsep{WIDTH} : for use inside an @ in the preamble. Causes a WIDTH space to be added between columns for the rest of the columns. This is in addition to the ordinary intercolumn space.

164 \def\@array[#1]{%
165   \if #1t\vtop \else \if#1b\vbox \else \vcenter \fi\fi
166   \bgroup

```

This next bit of code sets up the strut and then builds the `halign` and its preamble according to the specification in the second argument.

This code has been moved inside the box. A side effect of this has been to expose what was a buglet in the previous version: since the `\@arstrut` below is expanded and contains an `\ifmmode` then it could produce an unnecessary extra box in every row, thus wasting ‘lots of’ main memory.

```

167   \setbox\@arstrutbox\hbox{%
168     \vrule \Oheight\arraystretch\ht\strutbox
169     \Odepth\arraystretch \dp\strutbox
170     \Owidth\z@\}%
171   \Omkpream{\#2}%
172   \edef\@preamble{%
173     \ialign \noexpand\@halign to
174     \bgroup \Oarstrut \Opreamble \tabskip\z@skip \cr}%

```

That is the end of setting up the preamble; now we reset things before executing the `halign` built-up in `\@preamble`. The restorations could be done by introducing an extra group, thus saving tokens.

```

175 \let\@startpbox\O@startpbox \let\@endpbox\O@endpbox
176 \let\tabularnewline\%
177 \let\par\empty
178 \let\sharp##%
179 \set@typeset@protect
180 \lineskip\z@skip\baselineskip\z@skip

```

If the parsing of the preamble goes wrong there may be some characters left which TeX then tries to typeset, i.e., we would be in horizontal mode. That would produce an endless loop because the `\halign` expects vertical mode thus issues a `\par` but that is a no-op at this point. So we better test this case issue some error message and make a crude recovery by ending that horizontal mode with force. A better fix would be to ensure that we never pick up more than a single character token (not done).

```

\endgroup
END

```

The command `\def\caddamp{}` was removed from `\multicolumn` on 6 Dec 86 because it caused embedded array environments not to work. I think that it was included originally to prevent an error message if the 2nd argument to the `\multicolumn` command had two column specifiers.

8 Feb 89 — `\hbox{}` added after `\preamble` to correct bug that occurred if `\multicolumn` preceded `\[D]` with $D > 0$, caused by `\[]` command doing an `\unskip`, which removed `\tabcolsep` glue inserted by `\multicolumn`.

This has been made long so that, for example, a p-column can contain multiple paragraphs; maybe the arguments of @-expressions should also be able to contain multiple paragraphs.

```

\vline
334 \def\vline{\vrule \width \arrayrulewidth}

\cline \cline The old LATEX2.09 implementation of \cline used up quite a lot of memory and
\@cline two precious count registers. This new (1995/09/14) implementation does not use
any count registers. It is coded in a way that depends heavily on the definition of
\multispan so that command has been moved here from the file ltpplain.dtx.
      These counters are no longer declared.

\newcount\@cla
\newcount\@clb

335 \def\cline#1{\@cline#1\@nil}

336 \def\@cline#1-#2\@nil{%
337   \omit
      Use the counter from \multispan.
338   \multicnt#1%
339   \advance\multispan\m@ne
340   \ifnum\multicnt=\one\@firstofone{\&\omit}\fi

```

```

341   \@multicnt#2%
342   \advance\@multicnt-#1%
343   \advance\@multispan\@ne

```

The original had `\unskip` at this point, but how could a skip get here ???

```

344   \leaders\hrule\@height\arrayrulewidth\hfill
345   \cr

```

This is back spacing is fairly horrible, but it is what happened in the old version... An alternative would be to make `\cline` look ahead for a following `\cline` as does `\hline`. This would alter the spacing in existing documents so keep the old version in the kernel. Perhaps a package should do this differently.

```
346   \noalign{\vskip-\arrayrulewidth}
```

\mscount The `\mscount` counter is no longer declared, saving a csname and a register. It is declared in compatibility mode.

\multispan Modify `\multispan` slightly from its plain TeX definition to allow more efficient code sharing with `\multicolumn`. Also share a count register with `\multiput`.

```

\sp@n 347 \def\multispan{\omit\@multispan}
348 \def\@multispan#1{%
349   \@multicnt#1\relax
350   \loop\ifnum\@multicnt>\@ne \sp@n\repeat}
351 \def\sp@n{\span\omit\advance\@multicnt\m@ne}

```

\@startpbox Helper macros for ‘p’ columns.

\@endpbox `\@startpbox{<width>} text \egroup` is essentially `\parbox{<width>}{<text>}`
`\@endpbox` is essentially `\unskip \strut \par \egroup\hfil` (Changed 14 Jan 89) (changed again 1994/05/13)

```

352 \def\@startpbox#1{\vtop\bgroup \setlength\hsize{#1}\@arrayparboxrestore}
353 \def\@endpbox{\@finalstrut\@arstrutbox\par\egroup\hfil}

```

14 Jan 89: Def of `\@endpbox` changed from
`\def\@endpbox{\par\vskip\dp\@arstrutbox\egroup\hfil}`
so vertical spacing works out right if the last line of a ‘p’ entry has a descender.

```

\@@startpbox

355 \let\@@endpbox=\@endpbox
356 </2ekernel | autoload>

```

File D

ltpictur.dtx

59 Picture Mode

Picture mode commands. In addition to the commands available in L^AT_EX2.09, This section adds the new \qbezier command for drawing curves.

\qbezier \qbezier[(N)]((AX,AY)) $((BX,BY))$ $((CX,CY))$ plots a quadratic Bezier curve from (AX,AY) to (CX,CY) , with (BX,BY) as the third Bezier point, using $N + 1$ points equally spaced parametrically. If $N = 0$ (the default value), then a sufficient number of points are used to draw a connected curve—except that at most \qbeziermax + 1 points are drawn. A “point” is a square of side \@wholewidth.

\bezier In addition, to be compatible with the old **bezier** package, a variant of this command, \bezier, is defined, in which the first argument is not optional.

\unitlength	= value of dimension argument
\@wholewidth	= current line width
\@halfwidth	= half of current line width
\@linefnt	= font for drawing lines
\@circlefnt	= font for drawing circles

\linethickness{DIM} : Sets the width of horizontal and vertical lines in a picture to DIM. Does not change width of slanted lines or circles. Width of all lines reset by \thinlines and \thicklines

```
\picture(XSIZE,YSIZE)(XORG,YORG)
BEGIN
  \picht := YSIZE * \unitlength
  box \picbox :=
    \hbox{ XSIZE * \unitlength
      {\hskip -XORG * \unitlength
        \lower YORG * \unitlength
        \hbox{
          \ignorespaces %% added 13 June 89
        }
      }
    }
END

\endpicture ==
BEGIN
  } \hss }

```

```

    \@killglue
    \raise Y * \unitlength \hb@xt@ 0pt { \hskip X * \unitlength
                                         OBJ \hss
}
    \ignorespaces
END

\multiput(X,Y)(DELX,DELY){N}{OBJ} ==
BEGIN
    \@killglue
    \multicnt := N
    \xdim := X * \unitlength
    \ydim := Y * \unitlength
    while \multicnt > 0
        do \raise \ydim \hb@xt@ 0pt { \hskip \xdim
                                         OBJ \hss }
        \multicnt := \multicnt - 1
        \xdim := \xdim + DELX * \unitlength
        \ydim := \ydim + DELY * \unitlength
    od
    \ignorespaces
END

```

\shortstack[POS]{TEXT} : Makes a \vbox containing TEXT stacked as a one-column array, positioned l, r or c as indicated by POS.

The ‘2ekernel’ code ensures that a \usepackage{autopict} is essentially ignored if a ‘full’ format is being used that has picture mode already in the format.

CIRCLES AND OVALS

USER COMMANDS:

\circle{D} : Produces the circle with the diameter as close as possible to D * \unitlength. \put(X,Y){\circle{D}} puts the circle with its center at (X,Y).

\oval(X,Y) : Makes an oval as round as possible that fits in the rectangle of width X * \unitlength and height Y * \unitlength. The reference point is the center.

\oval(X,Y)[POS] : Save as \oval(X,Y) except it draws only the half or quadrant of the oval indicated by POS. E.G., \oval(X,Y)[t] draws just the top half and \oval(X,Y)[br] draws just the bottom right quadrant. In all cases, the reference point is the same as the unqualified \oval(X,Y) command.

\covvert {DELTA1} {DELTA2} : Makes a vbox containing either the left side or the right side of the oval being constructed. The baseline

will coincide with the outside bottom edge of the oval; the left side of the box will coincide with the left edge of the vertical rule. The width of the box will be `\@tempdima`.

`DELTA1` and `DELTA2` are added to the character number in

`\@tempcnta`

to get the characters for the top and bottom quarter circle pieces.

`\@ovhorz` : Makes an hbox containing the straight rule for either the top or the bottom of the oval being constructed. The baseline will coincide with bottom edge of the rule; the left side of the box will coincide with the left side of the oval.

The width of the box will be `\@ovxx`.

`\@getcirc {DIAM}` : Sets `\@tempcnta` to the character number of the top-right quarter circle with the largest diameter less than or equal to `DIAM`.

Sets `\@tempboxa` to an hbox containing that character.

Sets `\@tempdima` to `\wd \@tempboxa`, which is the distance from the circle's left outside edge to its right inside edge.

(These characters are like those described in the TeXbook, pp. 389-90.)

59.1 Curves

The new `\qbezier` command, based on the old `\bezier` defined in `bezier.sty`.

```

\qbezier[N] == \bezier{N}

\bezier{N}(AX,AY)(BX,BY)(CX,CY) ==
BEGIN
  IF N = 0
    THEN \@xdim := |BX - AX|
      \@xb := |CX - BX|
      \@xa := Max(\@xa, \@xb)
      \@ya := |BY - AY|
      \@yb := |CY - BY|
      \@ya := Max(\@ya, \@yb)
      @sc := Max(\@xa, \@ya)
      %% The coefficient .5 below is the degree of overlap of
      %% successive points, where 1 is no overlap and 0 is
      %% complete overlap. A coefficient of C multiplies
      %% the number of points plotted by 1/C.
      %%
      \@xa := .5 * \halfwidth
      @sc := @sc / \halfwidth
      @sc := Max(@sc, qbeziermax)
  ELSE @sc := N
  @scp := @sc+1
  \@xb := 2 * (BX - AX) * \unitlength
  \@xa := ((CX-AX)*\unitlength - \@xb)/@sc
  \@yb := 2 * (BY - AY) * \unitlength
  \@ya := ((CY-AY)*\unitlength - \@yb)/@sc
  \@pictdot := square rule of width \wholewidth
  \count@ := 0
  WHILE \count@ < @scp
    DO  \@xdim := ((\count@*\@xa + \@xb) / @sc) * \count@
        \@ydim := ((\count@*\@ya + \@yb) / @sc) * \count@
        plot pt with relative coords (\@xdim,\@ydim)
        \count@ := \count@+1
  OD

```

\qbeziermax The maximum number of points to plot.

```

60 Theorem Environments

The user creates his own theorem-like environments with the command

`\newtheorem{\langle name \rangle}{\langle text \rangle}[(\langle counter \rangle)]` or
`\newtheorem{\langle name \rangle}[(\langle oldname \rangle)]{\langle text \rangle}`

This defines the environment `\langle name \rangle` to be just as one would expect a theorem environment to be, except that it prints `\langle text \rangle` instead of "Theorem".

If `\langle oldname \rangle` is given, then environments `\langle name \rangle` and `\langle oldname \rangle` use the same counter, so using a `\langle name \rangle` environment advances the number of the next `\langle name \rangle` environment, and vice-versa.

If `\langle counter \rangle` is given, then environment `\langle name \rangle` is numbered within `\langle counter \rangle`.

E.g., if `\langle counter \rangle = subsection`, then the first `\langle name \rangle` in subsection 7.2 is numbered `\langle text \rangle` 7.2.1.

The way `\langle name \rangle` environments are numbered can be changed by redefining `\the\langle name \rangle`.

DOCUMENT STYLE PARAMETERS

`\@thmcnter{COUNTER}` : A command such that

`\edef\theCOUNTER{\@thmcnter{COUNTER}}`

defines `\theCOUNTER` to produce a number for a theorem environment.

The default is:

`BEGIN \noexpand\arabic{COUNTER} END`

`\@thmcntersep` : A separator placed between a theorem number and the number of the counter within which it is numbered.

E.g., to make the third theorem of section 7.2 be numbered 7.2-3, `\@thmcntersep` should be `\def`'ed to '-'. Its default is '-'.

`\@begintheorem{NAME}{NUMBER}` : A command that begins a theorem

environment for a 'theorem' named 'NAME NUMBER' –
e.g., `\@begintheorem{Lemma}{3.7}` starts Lemma 3.7.

`\@opargbegintheorem{NAME}{NUMBER}{OPARG}` :

A command that begins a theorem environment for a 'theorem' named 'NAME NUMBER' with optional argument OPARG – e.g., `\@begintheorem{Lemma}{3.7}{Jones}` starts 'Lemma 3.7 (Jones):'.

`\@endtheorem` : A command that ends a theorem environment.

`\newtheorem{NAME}{TEXT}[COUNTER] ==`

```

BEGIN
  if \NAME is definable
    then \@definecounter{NAME}
      if COUNTER present
        then \@newctr{NAME}[COUNTER] fi
          \theNAME == BEGIN \theCOUNTER \@thmcOUNTERsep
          eval\@thmcOUNTER{NAME}
END
  else \theNAME == BEGIN eval\@thmcOUNTER{NAME} END
  \NAME == \@thm{NAME}{TEXT}
  \endNAME == \endtheorem
else error
fi
END

\newtheorem{NAME}[OLDNAME]{TEXT} ==
BEGIN
  if counter OLDNAME nonexistant
    then ERROR
  else
    if \NAME is definable
      then BEGIN
        \theNAME == \theOLDNAME
        \NAME == \@thm{OLDNAME}{TEXT}
        \endNAME == \endtheorem
        END
      else error
    fi
  fi
END

\@thm{NAME}{TEXT} ==
BEGIN
  \@refstepcounter{NAME}
  if next char =
    then \@ythm{NAME}{TEXT}
    else \@xthm{NAME}{TEXT}
  fi
END

\@xthm{NAME}{TEXT} ==
BEGIN
  \@begintheorem{TEXT}{\theNAME}
  \ignorespaces
END

\@ythm{NAME}{TEXT}[OPARG] ==
BEGIN
  \@opargbegintheorem{TEXT}{\theNAME}{OPARG}
  \ignorespaces

```

```

END

\newtheorem \newtheorem ought really be allowed only in the preamble Which would be good
document style, and allow some main memory to be saved by declaring these
commands to be \onlypreamble. Unfortunately the LATEX book indicates that
\newtheorem may be used anywhere in the document...

61 Sectioning Commands

This file defines the declarations such as `\author` which are used by `\maketitle`. `\maketitle` itself is defined by each class, not in the L^AT_EX kernel.

The second part of the file defines the generic commands used for defining sectioning commands such as `\chapter`. Again the actual document level commands are defined in the class files, in terms of these commands.

```
1 {*2ekernel}
2 \message{title,}
```

61.1 The Title

`\title` The user defines the title and author by the declarations `\title{<name>}`, `\author{<name>}`
`\author` Similarly the date is declared with `\date{<date>}`.
`\date` Inside these, the `\thanks{<footnote text>}` command may be used to make
`\thanks` acknowledgements, notice of address, etc. in a footnote. If there are multiple
`\and` authors, they have to be separated with the `\and` command.
`\maketitle` And finally, the `\maketitle` command produces the actual title, using the
information previously saved with the other commands.

`\title` `\title` for use in `\maketitle`. If not given `\maketitle` will produce an error
`\@title` message.
3 `\def\title#1{\gdef\@title{#1}}`
4 `\def\@title{\@latex@error{No \noexpand\title given}\@ehc}`

`\author` `\author` for use in `\maketitle`. If not given `\maketitle` will produce a warning
`\@author` message.
5 `\def\author#1{\gdef\@author{#1}}`
6 `\def\@author{\@latex@warning@no@line{No \noexpand\author given}}`

`\date` `\date` for use in `\maketitle`. If not given `\maketitle` will produce `\today` as the
`\@date` default.
7 `\def\date#1{\gdef\@date{#1}}`
8 `\gdef\@date{\today}`

`\thanks`
9 `\def\thanks#1{\footnotemark}`
10 `\protected@xdef\@thanks{\@thanks`
11 `\protect\footnotetext[\the\c@footnote]{#1}}%`
12 }

`\@thanks`
13 `\let\@thanks\@empty`

```

\and
14 \def\and{%
15   \end{tabular}%
16   \hskip 1em \@plus.17fil%
17   \begin{tabular}[t]{c}}%  % \end{tabular}
18 \message{sectioning,}

```

61.2 Sectioning

\@secpenalty	
19 \newcount\@secpenalty	
20 \@secpenalty = -300	
\if@noskipsec	Way back in 1991 (08/26) FMi & RmS set the \@noskipsec switch to true for the preamble and to false in \document. This was done to trap lists and related text in the preamble but it does not catch everything.
\@noskipsectrue	
21 \newif\if@noskipsec \@noskipsectrue	
\@startsection	The \@startsection{\langle name\rangle}{\langle level\rangle}{\langle indent\rangle}{\langle beforeskip\rangle}{\langle afterskip\rangle}{\langle style\rangle}*[\langle altheading\rangle]{\langle heading\rangle} command is the mother of all the user level sectioning commands. The part after the *, including the * is optional.
name:	e.g., 'subsection'
level:	a number, denoting depth of section – e.g., chapter=1, section = 2, etc.
indent:	Indentation of heading from left margin
beforeskip:	Absolute value = skip to leave above the heading. If negative, then paragraph indent of text following heading is suppressed.
afterskip:	if positive, then skip to leave below heading, else negative of skip to leave to right of run-in heading.
style:	Commands to set style. Since June 1996 release the <i>last</i> command in this argument may be a command such as \MakeUppercase or \fbox that takes an argument. The section heading will be supplied as the argument to this command. So setting #6 to, say, \bfseries\MakeUppercase would produce bold, uppercase headings.
	If '*' is missing, then increment the counter. If it is present, then there should be no [\langle altheading\rangle] argument. The command uses the counter 'secnumdepth'. It contains a pointer to the highest section level that is to be numbered.
Warning:	The \@startsection command should be at the same or higher grouping level as the text that follows it. For example, you should <i>not</i> do something like
	<pre> \def\foo{ \begingroup ... \par{...} \endgroup} </pre>

```

61.3 Table of Contents etc.

61.3.1 Convention

`\tf@{foo}` = file number for output for table foo. The file is opened only if `@filesw = true`.

61.3.2 Commands

A `\l@{type}{\{entry\}}{\{page\}}` Macro needs to be defined by document style for making an entry of type `<type>` in a table of contents, etc. E.g., the document style should define `\l@chapter`, `\l@section`, etc.

Note: When the `\protect` command is used in the `<entry>` or `<text>` of one of the commands below, it causes the following control sequence to be written on the file without being expanded. The sequence will be expanded when the table of contents entry is processed.

Surprise: Inside an `\addcontentsline` or `\addtocontents` command argument, the commands: `\index`, `\glossary`, and `\label` are no-ops. This could cause a problem if the user puts an `\index` or `\label` into one of the commands he writes, or into the optional ‘short version’ argument of a `\section` or `\caption` command.

`\@starttoc` The `\@starttoc{\ext}` command is used to define the commands: `\tableofcontents`, `\listoffigures`, etc.

For example: `\@starttoc{lof}` is used in `\listoffigures`. This command reads the `.{\ext}` file and sets up to write the new `.{\ext}` file.

```

\@starttoc{EXT} ==
BEGIN
  \begingroup
    \makeatletter
    read file \jobname.EXT
    IF @filesw = true
      THEN open \jobname.EXT as file \tf@EXT
    FI

```

```

        @nobreak :=G FALSE  %% added 24 May 89
\endgroup
END

132 \def\@starttoc#1{%
133   \begingroup
134     \makeatletter
135     \@input{\jobname.\#1}%
136     \if@filesw
137       \expandafter\newwrite\csname tf@\#1\endcsname
138       \immediate\openout \csname tf@\#1\endcsname \jobname.\#1\relax
139     \fi
140     \nobreakfalse
141   \endgroup}

```

\addcontentsline The `\addcontentsline{<table>}{<type>}{<entry>}` command allows the user to add his/her own entry to a table of contents, etc. The command adds the entry `\contentsline{<type>}{<entry>}{<page>}` to the `.<table>` file.

This macro is implemented as an application of `\addtocontents`. Note that `\thepage` is not expandable during `\protected@write` therefore one gets the page number at the time of the `\shipout`.

```

142 \def\addcontentsline#1#2#3{%
143   \addtocontents{#1}{\protect\contentsline{#2}{#3}{\thepage}}}

```

\addtocontents The `\addtocontents{<table>}{<text>}` command adds `<text>` to the `.<table>` file, with no page number.

```

144 \long\def\addtocontents#1#2{%
145   \protected@write\@auxout{%
146     {\let\label\@gobble \let\index\@gobble \let\glossary\@gobble}%
147     {\string\@writefile{#1}{#2}}}}

```

\contentsline The `\contentsline{<type>}{<entry>}{<page>}` macro produces a `<type>` entry in a table of contents, etc. It will appear in the `.toc` or other file. For example, The entry for subsection 1.4.3 in the table of contents for example, might be produced by:

```

\contentsline{subsection}
  {\makebox[30pt]{r}{1.4.3} Gnats and Gnus}{22}

```

The `\protect` command causes command sequences to be written without expanding them.

```

148 \def\contentsline#1{\csname l@#1\endcsname}%
\@dottedtocline{<level>}{<indent>}{<numwidth>}{{<title>}{<page>}}: Macro
to produce a table of contents line with the following parameters:

```

level If `<level>` > `\c@tocdepth`, then no line produced.

indent Total indentation from the left margin.

numwidth Width of box for number if the `<title>` has a `\numberline` command.
As of 25 Jan 1988, this is also the amount of extra indentation added to second and later lines of a multiple line entry.

title Contents of entry.

page Page number.

Uses the following parameters, which must be set by the document style. They should be defined with \def's.

pnumwidth Width of box in which page number is set.

tocrmarg Right margin indentation for all but last line of multiple-line entries.

dotsep Separation between dots, in mu units. Should be \def'd to a number like 2 or 1.7

\@dottedtocline

```
149 \def\@dottedtocline#1#2#3#4#5{%
150   \ifnum #1>\c@tocdepth \else
151     \vskip \z@ \c@plus.2\p@
152     {\leftskip #2\relax \rightskip \c@tocrmarg \parfillskip -\rightskip
153      \parindent #2\relax\c@afterindenttrue
154      \interlinepenalty\@M
155      \leavevmode
156      \c@tempdima #3\relax
157      \advance\leftskip \c@tempdima \null\nobreak\hskip -\leftskip
158      {#4}\nobreak
159      \leaders\hbox{\$}\m@th}
```

If a document uses fonts other than computer modern, the use of a dot from math can be very disturbing despite the fact that this might be the only place in a document that then uses computer modern. Therefore we surround the dot with an \hbox to escape to the surrounding text font.

```
160     \mkern \c@dotsep mu\hbox{.}\mkern \c@dotsep
161     mu$\}\hfill
162     \nobreak
163     \hb@xt@\c@pnumwidth{\hfil\normalfont \normalcolor #5}%
164     \par}%
165 \fi}
```

Note: \nobreak's added 7 Jan 86 to prevent bad line break that left the page number dangling by itself at left edge of a new line.

Changed 25 Jan 88 to use \leftskip instead of \hangindent so leaders of multiple-line contents entries would line up properly.

\numberline \numberline{\langle number\rangle}: For use in a \contentsline command. It puts \langle number\rangle flushleft in a box of width \c@tempdima (Before 25 Jan 88 change, it also added \c@tempdima to the hanging indentation.)

```
166 \def\numberline#1{\hb@xt@\c@tempdima{#1\hfil}}
167 {/2ekernel}
```

File G

ltfloat.dtx

62 Floats

The different types of floats are identified by a *<type>* name, which is the name of the counter for that kind of float. For example, figures are of type ‘figure’ and tables are of type ‘table’. Each *<type>* has associated a positive *<type number>*, which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

The locations where a float can go are specified by a *<placement specifier>*, which is a list of the possible locations, each denoted by a letter as follows:

- h : here — at the current location in the text.
- t : top — at the top of a text page.
- b : bottom — at the bottom of a text page.
- p : page — on a separate float page

In addition, in conjunction with these, you can use ‘!’ which means that the current values of the float positioning parameters are ignored for this float. (Has no effect on ‘p’, float page positioning.) For example, ‘pht’ specifies that the float can appear in any of three locations: page, here or top.

62.1 Floating Environments

```
1 {*2ekernel}
2 \message{floats,}
```

Where floats may appear on a page, and how many may appear there are specified by the following float placement parameters. The numbers are named like counters so the user can set them with the ordinary counter-setting commands.

```
\c@topnumber      : Number of floats allowed at the top of a column.
\topfraction     : Fraction of column that can be devoted to floats.
\c@dbltopnumber, \dbltopfraction
                  : Same as above, but for double-column floats.
\c@bottomnumber, \bottomfraction
                  : Same as above for bottom of page.
\c@totalnumber   : Number of floats allowed in a single column,
                  including in-text floats.
{textfraction}   : Minimum fraction of column that must contain text.
{floatpagefraction}: Minimum fraction of page that must be taken
                   up by float page.
{dblfloatpagefraction}
                  : Same as above, for double-column floats.
```

The document style must define the following.

`\fps@TYPE` : The default placement specifier for floats of type TYPE.
`\ftype@TYPE` : The type number for floats of type TYPE.
`\ext@TYPE` : The file extension indicating the file on which the contents list for float type TYPE is stored.
For example, `\ext@figure` = 'lof'.
`\fnum@TYPE` : A macro to generate the figure number for a caption.
For example, `\fnum@TYPE` == Figure `\thefigure`.
`\@makecaption{NUM}{TEXT}` :
A macro to make a caption, with NUM the value produced by `\fnum@...` and TEXT the text of the caption.
It can assume it's in a `\parbox` of the appropriate width.
`\@float{TYPE}[PLACEMENT]` : This macro begins a float environment for a single-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is defined by `\fps@TYPE`. The environment is ended by `\end@float`.
E.g., `\figure == \@float{figure}, \endfigure == \end@float`.

```

\@float{TYPE}[PLACEMENT] ==
BEGIN
  if hmode then \@bsphack
    \@floatpenalty := -10002
  else \@floatpenalty := -10003
  fi
  \@capttype ==L TYPE
  \@dblflset
  \@fps ==L PLACEMENT
  \@onelevel@sanitize \@fps
  add default PLACEMENT if at most ! in PLACEMENT ==
\@fpsadddefault
  if inner
    then LaTeX Error: 'Not in outer paragraph mode.'
    \@floatpenalty := 0
  else if \@freelist nonempty
    then \@currbox :=L head of \@freelist
    \@freelist :=G tail of \@freelist
    \count@\currbox :=G 32*\ftype@TYPE +
      bits determined by
PLACEMENT
  else \@floatpenalty := 0
    LaTeX Error: 'Too many unprocessed floats'
  fi

```

```

fi
\@currbox :=G \color@vbox
\normalcolor
\vbox{
%% 15 Dec 87 -
%% removed \boxmaxdepth :=L 0pt
%% that made box 0 depth because it screwed
%% things up. Instead, added \vskip0pt at
end
\hsize = \columnwidth
\@parboxrestore
\@floatboxreset
END

\caption ==
BEGIN
\refstepcounter{@cattyp}
\@dblarg{\@caption{\@cattyp}}
END

```

In following definition, `\par` moved from after `\addcontentsline` to before `\addcontentsline` because the `\write` could cause an extra blank line to be added to the paragraph above the caption. (Change made 12 Jun 87)

```

\@caption{TYPE}[STEXT]{TEXT} ==
BEGIN
\par
\addcontentsline{\ext@TYPE}{TYPE}{\numberline{\theTYPE}{STEXT}}
\begingroup
\@parboxrestore
\normalsize
\makecaption{\fnum@TYPE}{TEXT}
\par
\endgroup
END

```

`\@dblfloat{TYPE}[PLACEMENT]` : Macro to begin a float environment for a double-column float of type TYPE with PLACEMENT as the placement specifier. The default value of PLACEMENT is 'tp'. The environment is ended by `\end@dblfloat`. E.g., `\figure*` == `\@dblfloat{figure}`, `\endfigure*` == `\end@dblfloat`.

```
\@dblfloat{TYPE}[PLACEMENT] ==
```

```

    Identical to \@float{TYPE}[PLACEMENT] except \hsize and
\linewidth
    are set to \textwidth.

18   \begingroup

The paragraph setting parameters are normalised at this point, however
\@parboxrestore resets \everypar which is not correct in this context so
\@setminipage is called if needed.

The float mechanism, like minipage, sets the flag @minipage true before executing the user-supplied text. Many LATEX constructs test for this flag and do not add vertical space when it is true. The intention is that this emulates TEX's 'top of page' behaviour. The flag must be set false at the start of the first paragraph. This is achieved by a redefinition of \everypar, but the call to \@parboxrestore removes that redefinition, so it is re-inserted if needed. If the flag is already false then the \caption was not the first entry in the float, and so some other paragraph has already activated the special \everypar. In this case no further action is needed.

\fps@dbl Note that all double floats have default fps ‘tp’.

\@setfps This sets the fps, dealing with error conditions by adding the default.

\@xfloat The first part of this sets the count register that stores all the information about
the type and fps of the float.
      We assume here that the default specifiers already contain no active characters.
      It may be better to store the defaults as numbers, rather than symbol strings.

```

The remainder sets up the box in which the float is typeset, and the typesetting environment to be used. It is essential to have the extra box to avoid the unwanted space that would otherwise often be put at the top of the float.

It ends with a hook; not sure how useful this is but it is needed at present to deal with double-column floats.

```

91  \global \setbox\@currbox
92      \color@vbox
93      \normalcolor
94      \vbox \bgroup
95          \hsize\columnwidth
96          \parboxrestore
97          \floatboxreset
98 }

```

\@floatboxreset The rational for allowing these normally global flags to be set locally here, via **\parboxrestore**, was stated originally by Donald Arseneau and extended by Chris Rowley. It is because these flags are only set globally to true by section commands, and these should never appear within marginals or floats or, indeed, in any group; and they are only ever set globally to false when they are definitely true.

If anyone is unhappy with this argument then both flags should be treated as in **\setnobreak**; otherwise this command will be redundant.

184  \@fpsep \dblfpsep
185  \@fpbot \dblfpbot
186 }
```

MARGINAL NOTES:

Marginal notes use the same mechanism as floats to communicate with the `\output` routine. Marginal notes are distinguished from floats by having a negative placement specification. The command `\marginpar [LTEXT]{RTEXT}` generates a marginal note in a parbox, using LTEXT if it's on the left and RTEXT if it's on the right. (Default is RTEXT = LTEXT.) It uses the following parameters.

```
\marginparwidth : Width of marginal notes.
\marginparsep : Distance between marginal note and text.
               the page layout to determine how to move the marginal
               note into the margin. E.g., \leftmarginskip ==
               \hskip -\marginparwidth \hskip -\marginparsep .
\marginparpush : Minimum vertical separation between \marginpar's
```

Marginal notes are normally put on the outside of the page if `@mparswitch` = true, and on the right if `@mparswitch` = false. The command `\reversemarginpar` reverses the side where they are put. `\normalmarginpar` undoes `\reversemarginpar`. These commands have no effect for two-column output.

SURPRISE: if two marginal notes appear on the same line of text, then the second one could appear on the next page, in a funny position.

```
\marginpar [LTEXT]{RTEXT} ==

\marginparreset The rational for allowing these normally global flags to be set locally here, via
\parboxrestore was stated originally by Donald Arsenau and extended by Chris
Rowley. It is because these flags are only set globally to true by section commands,
and these should never appear within marginals or floats or, indeed, in any group;
and they are only ever set globally to false when they are definitely true.
If anyone is unhappy with this argument then both flags should be treated as
in \set@nobreak; otherwise this command will be redundant.

244 \message{footnotes,}

62.2 Footnotes

\footnote{NOTE} : User command to insert a footnote.

\footnote[*NUM*]{*NOTE*} : User command to insert a footnote numbered *NUM*, where *NUM* is a number – 1, 2, etc. For example, if footnotes are numbered *, **, etc. within pages, then \footnote[2]{...} produces footnote ***. This command does not step the footnote counter.

\footnotemark[*NUM*] : Command to produce just the footnote mark in the text, but no footnote. With no argument, it steps the footnote counter before generating the mark.

\footnotetext[*NUM*]{*TEXT*} : Command to produce the footnote but no mark. \footnote is equivalent to \footnotemark \footnotetext .

As in PLAIN, footnotes use \insert\footins, and the following parameters:

\footnotesize : Size-changing command for footnotes.

\footnotesep : The height of a strut placed at the beginning of every footnote.

\skip\footins : Space between main text and footnotes. The rule separating footnotes from text occurs in this space. This space lies above the strut of height \footnotesep which is at the beginning of the first footnote.

\footnoterule : Macro to draw the rule separating footnotes from text. It is executed right after a \vspace of \skip\footins. It should take zero vertical space—i.e., it should be a negative skip to compensate for any positive space it occupies. (See PLAIN.TEX.)

\interfootnotelinepenalty : Interline penalty for footnotes.

\thefootnote : In usual LaTeX style, produces the footnote number. If footnotes are to be numbered within pages, then the document style file must include an \addtoreset command to cause the footnote counter to be reset when the page counter is stepped. This is not a good idea, though, because the counter will not always be reset in time to ensure that the first footnote on a

page is footnote number one.

`\@thefnmark` : Holds the current footnote's mark—e.g., `\dag` or '1' or 'a'.

`\@mpfnnumber` : A macro that generates the numbers for `\footnote` and `\footnotemark` commands. It == `\thefootnote` outside a `minipage` environment, but can be changed inside to generate numbers for `\footnote`'s.

`\@makefnmark` : A macro to generate the footnote marker from `\@thefnmark`. The default definition was `\hbox{$^{\@thefnmark}$}`.

This is now replaced by
`\@thefnmark`

`\@makefntext{NOTE}` :

Must produce the actual footnote, using `\@thefnmark` as the mark of the footnote and NOTE as the text. It is called when effectively inside a `\parbox`, with `\hsize = \columnwidth`.

For example, it might be as simple as
`$^{\@thefnmark}$ NOTE`

In a `minipage` environment, `\footnote` and `\footnotetext` are redefined so that

(a) they use the counter `mpfootnote`
(b) the footnotes they produce go at the bottom of the `minipage`.
The switch is accomplished by letting `\@mpfn` == footnote or mpfootnote and `\thempfn` == `\thefootnote` or `\thempfootnote`, and by redefining `\@footnotetext` to be `\@mpfootnotetext` in the `minipage`.

```
\footnote{NOTE} ==
BEGIN
\stepcounter{\@mpfn}
begingroup
\protect == \noexpand
\@thefnmark :=G eval (\thempfn)
endgroup
\@footnotemark
\@footnotetext{NOTE}
END

\footnote[NUM]{NOTE} ==
BEGIN
begingroup
\protect == \noexpand
counter \@mpfn :=L NUM
\@thefnmark :=G eval (\thempfn)
```

```

endgroup
\@footnotemark
\@footnotetext{NOTE}
END

\footnotemark == BEGIN \stepcounter{footnote}
begingroup

64 Bibliography Generation

A bibliography is created by the `thebibliography` environment, which generates a title such as “References”, and a list of entries. The BIBTEX program will create a file containing such an environment, which will be read in by the `\bibliography` command. With BIBTEX, the following commands will be used.

`\bibliography`

`\bibliographystyle{<style>}` : specifies the bibdata files. Writes a `\bibdata` entry on the `.aux` file and tries to read in `mainfile.bbl`.

`\bibliographystyle{<style>}` : Writes a `\bibstyle` entry on the `.aux` file.

The `thebibliography` environment is a list environment. To save the use of an extra counter, it should use `enumiv` as the item counter. Instead of using `\item`, items in the bibliography are produced by the following commands:

`\bibitem{<name>}` : Produces a numbered entry cited as `<name>`.

`\bibitem[<label>]{<name>}` : Produces an entry labeled by `<Label>` and cited by `<name>`.

The former is used for bibliographies with citations like [1], [2], etc.; the latter is used for citations like [Knuth82].

The document class must define the `thebibliography` environment. This environment has a single argument, which is the widest bibliography label— e.g., if the [Knuth67] is the widest entry, then this argument will be Knuth67. The `\thebibliography` command must begin a list environment, which the `\endthebibliography` command ends.

Entries are cited by the command `\cite{<name>}`.

`\nocite{<citations>}` puts information on the `.aux` file that causes BIBTEX to include the `{<citations>}` list in the bibliography, but puts nothing in the text.

`\nocite{*}` is special: it tells BIBTEX to put the whole of a collection of references into the bibliography.

1 `(*2ekernel)`
2 `\message{bibliography,}`

PARAMETERS

`\@cite` : A macro such that `\@cite{LABEL1,LABEL2}{NOTE}` produces the output for a `\cite[NOTE]{FOO1,FOO2}`

command,

where entry FOOi is defined by `\bibitem[LABELi]{FOOi}`.

The switch @tempswa is true if the optional NOTE

argument

is present.

The default definition is :

```
\@cite{LABELS}{NOTE} ==
BEGIN [LABELS
      IF @tempswa = T THEN , NOTE FI
    ]
END
```

\@biblabel : A macro to produce the label in the bibliography entry. For \bibitem[LABEL]{NAME}, the label is generated by \@biblabel{LABEL}. It has the default definition \@biblabel{LABEL} -> [LABEL].

CONVENTION

\b@FOO : The name or number of the reference created by \cite{FOO}
E.g., if \cite{FOO} -> [17] , then \b@FOO -> 17.

```

19      \if@filesw\immediate\write\auxout{\string\citation{\@citeb}}\fi

```

Using \hbox instead of \mbox is fine because of the \leavevmode above. In fact the use of a box around the citation contents is more than questionable in my view (FMi), but within 2e I have to keep that for compatibility reasons as it would probably change too many existing documents. Its main reason is to avoid hyphenation of labels such as [FOOB89] into [FOO- B89] so in certain styles it makes sense; but, for example, in author year citations it becomes more than questionable.

So Chris added yet another hook here, as suggested by, at least, Donald Arsenau. Note that this one is inside the first argument of the \cite hook. This decouples the top-level typesetting of the citation from the details of the other business conducted here. All this really needs a complete rethink to get the right modularity.

```

20     \cifundefined{b@\citeb}{\hbox{\reset@font\bfseries ?}}%
21         \G@refundefinedtrue
22         \G@warning
23             {Citation `'\citeb' on page \thepage \space undefined}%
24             {\cite@ofmt{\csname b@\citeb\endcsname}}}\#1}
25 \let\bibdata=\gobble
26 \let\bibstyle=\gobble
\bibliography
27 \def\bibliography#1{%
28   \if@filesw
29     \immediate\write\auxout{\string\bibdata{#1}}%
30   \fi
31   \input{\jobname.bbl}}
\bibliographystyle
32 \def\bibliographystyle#1{%
33   \ifx\begindocumenthook\undefined\else
34     \expandafter\AtBeginDocument
35   \fi
36   {\if@filesw
37     \immediate\write\auxout{\string\bibstyle{#1}}%
38   \fi}}
\nocite (Added 14 Jun 85)

```

This puts information on the .aux file that causes BIBTEX to include the citation list in the bibliography, but puts nothing in the text.

RmS 93/08/06: Made loop for \nocite like that for \citex, to get rid of leading spaces.

```
39 \def\nocite#1{\bsphack
```

With the implementation designed already in LATEX 2.09 the \nocite command will not work before \begin{document} since it tries to write to the .aux file which is not open before that point. As a result the “reference” will appear on the terminal and nothing else will happen.

This would be easy to fix, but then a document using the fix will silently fail on an older release of LATEX, missing all citations done with \nocite. Thus we do only generate an error message and leave the fix for a LATEX 2_ε successor.

```
40 \ifx\onlypreamble\document
```

Since we are after \begin{document} we can do the citations:

```

41   \for\citeb:=#1\do{%
42     \edef\citeb{\expandafter\firstofone\citeb}%
43     \if@filesw\immediate\write\auxout{\string\citation{\citeb}}\fi
44     \cifundefined{b@\citeb}{\G@refundefinedtrue
```

```

45      \@latex@warning{Citation ‘\@citeb’ undefined}{}%
46  \else
But before \begin{document} we raise an error message:
47  \@latex@error{Cannot be used in preamble}\@eha
Without the compatibility problems we could fix the problem as follows:
48  % \AtBeginDocument{\nocite{#1}}
49  \fi
50  \@esphack}
Since \nocite{*} should not produce a warning about undefined citation keys
(see PR 557), we need to set the control sequence ‘\b@*’ to something other than
\relax. As a result \cite{*} will not warn either (but that never worked with
BIBTEX in the first place).
51 \expandafter\let\csname b@*\endcsname\empty

```

64.1 Default definitions

This hook determines the ‘relative formatting’ of the two logical parts of a citation with comment.

```

\@cite
52 \def\@cite#1#2{[#1\if@tempswa , #2\fi]}
\@cite@ofmt This is, in general, a command that appears to have one argument whose value is,
in the kernel, a single cs whose name is the expansion of b@\@citeb; the expansion
of this cs will typically be some hmode material that produces the detailed typeset
form of just the citations themselves.
53 \let\@cite@ofmt\hbox
\@biblabel
54 \def\@biblabel#1{[#1]}
55 (/2ekernel)

```

ltpage.dtx

65 Page styles and related commands

65.1 Page Style Commands

\pagestyle{\{style\}} : sets the page style of the current and succeeding pages to *style*

\thispagestyle{\{style\}} : sets the page style of the current page only to *style*.

To define a page style *style*, you must define \ps@*style* to set the page style parameters.

65.2 How a page style makes running heads and feet

The \ps@... command defines the macros \oddhead, \oddfoot, \evenhead, and \evenfoot to define the running heads and feet. (See output routine.) To make headings determined by the sectioning commands, the page style defines the commands \chaptermark, \sectionmark, etc., where \chaptermark{\{text\}} is called by \chapter to set a mark. The \...mark commands and the \...head macros are defined with the help of the following macros.

(All the \...mark commands should be initialized to no-ops.)

65.3 marking conventions

LATEX extends TEX's \mark facility by producing two kinds of marks a 'left' and a 'right' mark, using the following commands:

\markboth{\{left\}}{\{right\}} : Adds both marks.

\markright{\{right\}} : Adds a 'right' mark.

\leftmark : Used in the output routine, gets the current 'left' mark. Works like TEX's \botmark.

\rightmark : Used in the output routine, gets the current 'right' mark. Works like TEX's \firstmark. The marking commands work reasonably well for right marks 'numbered within' left marks—e.g., the left mark is changed by a \chapter command and the right mark is changed by a \section command. However, it does produce somewhat anomalous results if 2 \markboth's occur on the same page.

Commands like \tableofcontents that should set the marks in some page styles use a \mkboth command, which is \let by the pagestyle command (\ps@...) to \markboth for setting the heading or to \gobbletwo to do nothing.

1 (*2ekernel)

\pagestyle User command to set the page style for this and following pages.

```
2 \def\pagestyle#1{%
3   \ifundefined{ps@#1}%
4     \undefinedpagestyle
5     {\@nameuse{ps@#1}}}
```

\thispagestyle	User command to set the page style for this page only.
	<pre> 6 \def\thispagestyle#1{% 7 \@ifundefined{ps@#1}% 8 \undefinedpagestyle 9 {\global\@specialpagetrue\gdef\@specialstyle{#1}}}</pre>
\ps@empty	The empty page style: No head or foot line.
	<pre> 10 \def\ps@empty{% 11 \let\@mkboth\@gobbletwo\let\@oddhead\@empty\let\@oddfoot\@empty 12 \let\@evenhead\@empty\let\@evenfoot\@empty}</pre>
\ps@plain	The plain page style: No head, centred page number in foot.
	<pre> 13 \def\ps@plain{\let\@mkboth\@gobbletwo 14 \let\@oddhead\@empty\def\@oddfoot{\reset@font\hfil\thepage 15 \hfil}\let\@evenhead\@empty\let\@evenfoot\@oddfoot}</pre>
\@leftmark \@rightmark	We implement \@leftmark and \@rightmark in terms of already defined commands to save token space. We can't get rid of them since they are sometimes used in applications.
	<pre> 16 \let\@leftmark\@firstoftwo 17 \let\@rightmark\@secondoftwo</pre>
\markboth	User commands for setting L ^A T _E X marks.
\markright	Test for \@nobreak added 15 Apr 86 in \markboth and \markright letting \label and \index to \relax added 22 Feb 86 so these commands can appear in sectioning command arguments RmS 91/06/21 Same for \glossary

```

PAGE LAYOUT PARAMETERS

```
\topmargin      : Extra space added to top of page.
@twoside       : boolean. T if two-sided printing
\oddsidemargin : IF @twoside = T
                  THEN extra space added to left of odd-numbered
                  pages.
                  ELSE extra space added to left of all pages.
\evensidemargin : IF @twoside = T
                  THEN extra space added to left of
even-numbered
                  pages.
\headheight    : height of head
\headsep       : separation between head and text
\footskip      : distance separation between baseline of last
                  line of text and baseline of foot.
                  Note difference between \footSKIP and \headSEP.
\textheight    : height of text on page, excluding head and foot
\textwidth     : width of printing on page
\columnsep    : IF @twocolumn = T
                  THEN width of space between columns
\columnseprule : IF @twocolumn = T
                  THEN width of rule between columns (0 if none).
\columnwidth   : IF @twocolumn = T
                  THEN ( $\textwidth - \columnsep$ )/2
                  ELSE \textwidth
                  It is set by the \twocolumn and
```

`\onecolumn` commands.
`\@textbottom` : Command executed at bottom of vbox holding text
of page (including figures). The `\raggedbottom` command almost `\let`'s this to `\vfil` (actually sets it to `\vskip \z@ plus.0001fil`). Should have depth 0pt.
`\@texttop` : Command executed at top of vbox holding text of page (including figures). Used by letter style; can also be used to produce centered pages. Let to `\relax` by `\raggedbottom` and
`\flushbottom`.

Page layout must initialize `\@colht` and `\@colroom` to `\textheight`.

PAGE STYLE PARAMETERS:

`\floatsep` : Space left between floats.
`\textfloatsep` : Space between last top float or first bottom float and the text.
`\topfigrule` : Command to place rule (or whatever) between floats at top of page and text. Executed in inner vertical mode right before the `\textfloatsep` skip separating the floats from the text. Must occupy zero vertical space. (See `\footnoterule`.)
`\botfigrule` : Same as `\topfigrule`, but put after the `\textfloatsep` skip separating text from the floats at bottom of page.
`\intextsep` : Space left on top and bottom of an in-text float.
`\dblfloatsep` : Space between double-column floats.
`\dbltextfloatsep` : Space between top double-column floats and text.
`\dblfigrule` : Similar to `\topfigrule`, but for double-column floats.
`\@fptop` : Glue to go at top of float column – must be 0pt + stretch
`\@fpsep` : Glue to go between floats in a float column.
`\@fpbot` : Glue to go at bottom of float column – must be 0pt + stretch
`\@dblftop, \@dblfpsep, \@dblfpbot` : Analogous for double-column float page in two-column format.

FOOTNOTES: As in PLAIN, footnotes use `\insert\footins`.

PAGE LAYOUT SWITCHES AND MACROS

`@twocolumn` : Boolean. T if two columns per page globally.

PAGE STYLE MACROS AND SWITCHES

\@oddhead : IF @twoside = T
THEN macro to generate head of
odd-numbered pages.
ELSE macro to generate head of all pages.

\@evenhead : IF @twoside = T
THEN macro to generate head of
even-numbered pages.

\@oddfoot : IF @twoside = T
THEN macro to generate foot of
odd-numbered pages.
ELSE macro to generate foot of all pages.

\@evenfoot : IF @twoside = T
THEN macro to generate foot of
even-numbered pages.

@specialpage : boolean. T if current page is to have a special format.

\@specialstyle : If its value is foo then
IF @specialpage = T
THEN the command \ps@foo is executed to
temporarily reset the page style parameters
before composing the current page.
This command should execute only \def's
and \edef's, making only local definitions.

FLOAT PLACEMENT PARAMETERS

The following parameters are set by the macro \@floatplacement.

When \@floatplacement is called,

\@colht is the height of the page or column being built. I.e.:

- * For single-column page it equals \textheight.
- * For double-column page it equals \textheight - height
of double-column floats on page.

Note that some are set globally and some locally:

\@topnum :=G Maximum number of floats allowed on the top of a column.

\@toproom :=G Maximum amount of top of column devoted to floats--
excluding \textfloatsep separation below the floats
and \floatsep separation between them. For
two-column output, should be computed as a function
of \@colht.

\@botnum, \@botroom
: Analogous to above.

```

\@colnum  :=G Maximum number of floats allowed in a column,
              including in-text floats.
\@textmin :=L Minimum amount of text (excluding footnotes) that
              must appear on a text page.
                %% 27 Sep 85 : made local to
                %% \@addtocurcol and \@addtonextcol
              It is now also used locally in processing double
              floats.
\@fpmin   :=L Minimum height of floats in a float column.

```

The macro `\@dblfloatplacement` sets the following parameters.

```

\@dbltopnum :=G Maximum number of double-column floats allowed
at
              the top of a two-column page.
\@dbltoproom :=G Maximum height of double-column floats allowed at
               top of two-column page.
\@fpmin      :=L Minimum height of floats in a float column.
It should also perform the following local assignments where necessary
– i.e., where the new value differs from the old one:
\@fptop     :=L \@dblftop
\@fpsep     :=L \@dblfpsep
\@fpbot     :=L \@dblfpbot

```

OUTPUT ROUTINE VARIABLES

```

\@colht : The total height of the current column. In single column
          style, it equals \textheight. In two-column style, it is
          \textheight minus the height of the double-column floats
          on the current page. MUST BE INITIALIZED TO
\textheight.

\@colroom : The height available in the current column for text and
            footnotes. It equals \@colht minus the height of all
            floats committed to the top and bottom of the current
            column.

\@textfloatsheight : The total height of in-text floats on the
                     current page.

\footins : Footnote insertion number.

\@maxdepth : Saved value of TeX's \maxdepth. Must be set
             when any routine sets \maxdepth.

```

CALLING THE OUTPUT ROUTINE

The output routine is called either by TeX's normal page-breaking mechanism, or by a macro putting a penalty < or = -10000 in the output list. In the latter case, the penalty indicates why the output

routine was called, using the following code.

penalty	reason
-10000	\pagebreak \newpage
-10001	\clearpage (\penalty -10000 \vbox{} \penalty -10001)
-10002	float insertion, called from horizontal mode
-10003	float insertion, called from vertical mode.
-10004	float insertion.

Note: A float or marginpar puts the following sequence in the output list:
 (i) a penalty of -10004,
 (ii) a null \vbox
 (iii) a penalty of -10002 or -10003.

This solves two special problems:

1. If the float comes right after a \newpage or \clearpage, then the first penalty is ignored, but the second one invokes the output routine.
2. If there is a split footnote on the page, the second 'page' puts out the rest of the footnote.

THE OUTPUT ROUTINE

FUNCTIONS USED IN THE OUTPUT ROUTINE:

\@outputpage : Produces an output page with the contents of box \@outputbox as the text part.
 Also sets \@colht :=G \textheight.
 The page style is determined as follows.
 IF @thispagestyle = true
 THEN use \thispagestyle style
 ELSE use ordinary page style.

\@tryfcolumn\FLIST : Tries to form a float column composed of floats from \FLIST (if nonempty) with the following parameters:
 \@colht : height of box
 \@fpmin : minimum height of floats in the box
 \@fpsep : interfloat space
 \@fptop : glue at top of box
 \@fpbot : glue at bottom of box.
 If it succeeds, then it does the following:
 * \@outputbox :=L the composed float box.
 * @fcollmade :=G true
 * \FLIST :=G \FLIST - floats put in box
 * \@freelist :=G \@freelist + floats put in box
 If it fails, then:
 * @fcollmade :=G false
 NOTE: BIT MUST BE A SINGLE TOKEN!

\@makefcolumn \FLIST : Same as \@tryfcolumn except that it fails to make a float column only if \FLIST is empty. Otherwise, it makes a float column containing at least the first box in \FLIST, disregarding \@fpmin.

\@startcolumn :
Calls \@tryfcolumn\@deferlist. If \@tryfcolumn returns with (globally set) @fcolmade = false, then:

- * Globally sets \@topl and \@botl to floats from \@deferlist to go at top and bottom of column, deleting them from \@deferlist. It does this using \@colht as the total height, the page style parameters \@floatsep and \@textfloatsep, and the float placement parameters \@topnum, \@toproom, \@botnum, \@botroom, \@colnum and \@textfraction.
- * Globally sets \@colroom to \@colht minus the height of the added floats.

\@startdblcolumn :
Calls \@tryfcolumn\@dbldeferlist{8}. If \@tryfcolumn returns with (globally set) @fcolmade = false, then:

- * Globally sets \@dbltopl to floats from \@dbldeferlist to go at top and bottom of column, deleting them from \@dbldeferlist. It does this using \@textheight as the total height, and the parameters \@dblfloatsep, etc.
- * Globally sets \@colht to \@textheight minus the height of the added floats.

\@combinefloats : Combines the text from box \@outputbox with the floats from \@topl and \@botl, putting the new box in \@outputbox. It uses \@floatsep and \@textfloatsep for the appropriate separations. It puts the elements of \@TOPLIST and \@BOTLIST onto \@freelist, and makes those lists null.

\@makecol : Makes the contents of \box255 plus the accumulated footnotes, plus the floats in \@topl and \@botl, into a single column of height \@colht (unless the page height has been locally changed), which it puts into box \@outputbox. It puts boxes in \@midlist back onto \@freelist and restores \@maxdepth.

\@opcol : Outputs a column whose text is in box \@outputbox
If @twocolumn = false, then it calls \@outputpage, sets \@colht :=G \@textheight, and calls \@floatplacement.

If `@twocolumn = true`, then:
 If `@firstcolumn = true`, then it puts box `\@outputbox`
 into `\@leftcolumn` and sets `@firstcolumn :=G false`.
 If `@firstcolumn = false`, then it puts out the current
 two-column page, any possible two-column float pages,
 and determines `\@dbltoplist` for the next page.

USER COMMANDS THAT CALL OR AFFECT THE OUTPUT ROUTINE

```

\newpage == BEGIN \par\vfil\penalty -10000 END

\clearpage == BEGIN \newpage
    \write -1{}% Part of hack to make sure no
    \vbox{}% \write's get lost.
    \penalty -10001
END

\cleardoublepage == BEGIN \clearpage
    if @twoside = true and c@page is even
        then \hbox{} \newpage fi
    END

```

`\twocolumn[BOX]` : starts a new page, changing to `twocolumn` setting
 and puts `BOX` in a `parbox` of width `\textwidth` across the top.
 Useful for full-width titles for double-column pages.
 SURPRISE: The stretch from `\@dbltextfloatsep` will be inserted
 between the `BOX` and the top of the two columns.

FLOAT-HANDLING MECHANISMS

The float environment obtains an insertion number `B` from the
`\@freelist` (see below for a description of list manipulation), puts
 the float into box `B` and sets `\count B` to a FLOAT SPECIFIER. For
 a normal (not double-column) float, it then causes a page break
 in one of the following two ways:

- In outer hmode: `\vadjust{\penalty -10002}`
- In vmode : `\penalty -10003`.

For a double-column float, it puts `B` onto the `\@dbldeferlist`.

The float specifier has two components:

- * A PLACEMENT SPECIFICATION, describing where the float may
 be placed.
- * A TYPE, which is a power of two—e.g., figures might be

type 1 floats, tables type 2 floats, programs type 4 floats, etc.
The float specifier is encoded as follows, where bit 0 is the least significant bit.

Bit	Meaning
0	1 iff the float may go where it appears in the text.
1	1 iff the float may go on the top of a page.
2	1 iff the float may go on the bottom of a page.
3	1 iff the float may go on a float page.
4	1 unless the PLACEMENT includes a !
5	1 iff a type 1 float
6	1 iff a type 2 float
	etc.

A negative float specifier is used to indicate a marginal note.

MACROS AND DATA STRUCTURES FOR PROCESSING FLOATS

A FLOAT LIST consisting of the floats in boxes `\boxa ... \boxN` has the form:

`\@elt \boxa ... \@elt \boxN`
where `\boxI` is defined by
`\newinsert\boxI`

Normally, `\@elt` is `\let` to `\relax`. A test can be performed on the entire float list by locally `\def`'ing `\@elt` appropriately and executing the list.

This is a lot more efficient than looping through the list.

The following macros are used for manipulating float lists.

```
\@next \CS \LIST {NONEEMPTY}{EMPTY} == %% NOTE: ASSUME
\@elt = \relax
    BEGIN assume that \LIST == \@elt \B1 ... \@elt \Bn
        if n = 0
            then EMPTY
            else \CS :=L \B1
                \LIST :=G \@elt \B2 ... \@elt \Bn
                NONEEMPTY
        fi
    END
```

`\@bitor\NUM\LIST` : Globally sets switch `@test` to the disjunction for all I of bit $\log_2 \NUM$ of the float specifiers of all the floats in `\LIST`.
I.e., `@test` is set to true iff there is at least one float in `\LIST` having bit $\log_2 \NUM$ of its float specifier equal to 1.

Note: $\log_2 [(\text{\count} I)/32]$ is the bit number corresponding to the type of float I. To see if there is any float in \LIST having the same type as float I, you run \@bitor with

$\text{\NUM} = [(\text{\count} I)/32] * 32.$

```
\@bitor\NUM\LIST ==
BEGIN
  @test :=G false
  { \@elt \CTR ==  if \NUM <> 0 then
    if \count\CTR / \NUM is odd
      then @test := true      fi fi
    \LIST
  }
END
```

\@cons\LIST\NUM : Globally sets \LIST := \LIST * \@elt \NUM

```
\@cons\LIST\NUM ==
BEGIN { \@elt == \relax
         \LIST :=G \LIST \@elt \NUM
       }
```

BOX LISTS FOR FLOAT-PLACEMENT ALGORITHMS

\@freelist	: List of empty boxes for placing new floats.
\@toplist	: List of floats to go at top of current column.
\@midlist	: List of floats in middle of current column.
\@botlist	: List of floats to go at bottom of current column.
\@deferlist	: List of floats to go after current column.
\@dbltoplist	: List of double-col. floats to go at top of current page.
\@dbldeferlist	: List of double-column floats to go on subsequent pages.

FLOAT-PLACEMENT ALGORITHMS

\@addtobot : Tries to put insert \@currbox on \@botlist.

Called only when:

- * \ht BOX < \@colroom
- * type of \@currbox not on \@deferlist
- * \@colnum > 0
- * @insert = false

If it succeeds, then:

- * sets @insert true
- * decrements \@botroom by \ht BOX
- * decrements \@botnum and \@colnum by 1

```

* decrements \@colroom by \ht BOX + either
\floatsep
    or \textfloatsep, as appropriate.
* sets \maxdepth to 0pt

\@addtotoporbot : Tries to put insert \@currbox on \@toplolist or
                    \@botlist.
Called only under same conditions as \@addtobot.
If it succeeds, then:
    * sets @insert true
    * decrements \@toproom or \@botroom by \ht
BOX
    * decrements \@colnum and either \@topnum or
        \@botnum by 1
    * decrements \@colroom by \ht BOX +
\floatsep
    or \textfloatsep, as appropriate.

\@addtocurcol : Tries to add \@currbox to current column, setting
                  @insert true if it succeeds, false otherwise.
It will add \@currbox to top only if bit 0 of
\count \@currbox is 0, and to the bottom only if
bit 0 = 0 or an earlier float of the same type is
put on the bottom.
If the float is put in the text, then
\penalty\interlinepenalty is put
right after the float, before the following \vskip,
and \outputpenalty :=L 0.

\@addtonextcol : Tries to add \@currbox to the next column, setting
                  @insert true if it succeeds, false otherwise.

\@addtobdblcol : Tries to add \@currbox to the next double-column page,
                  adding it to \@dbltoplolist if it succeeds and
                  \@dbldeferlist if it fails.

\@addmarginpar ==
BEGIN
if \@currlist nonempty
    then remove \@marbox from \@currlist
        add \@marbox and \@currbox to \@freelist
        %% NOTE: \@currbox = left box
    else LaTeX error: ? %% shouldn't happen
fi
\@tempcnta := 1      %% 1 = right, -1 = left
if @twocolumn = true
    then if @firstcolumn = true
        then \@tempcnta := -1
    fi
```

```

else if @mparswitch = true

```

This setting of \dbltopnum is used only to change the typesetting in \combinedblfloats.

```

186 \global \dbltopnum \m@ne
187 (*trace)
188   \tr@ce{\dbltopnum set to -1 (= \the \dbltopnum) (topnewpage)}%
189 (/trace)

```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present; but note that this value is larger than that used when checking that page is too full of normal floats.

If there is little room left we just force a page-break, OK? This involves producing two empty columns. The second empty column may be produced by \output, in which case an extra, misleading, warning will be generated, OK? (This happens only when there is too little room left on the page for any float.) Otherwise (i.e. if the size is such that it is allowed as a normal float) the extra \emptycol will be invoked in the second column by the conditional code guarded by the \if@firstcolumn test.

I now think that the cut-off point here should be 3\baselineskip, but we make it a bit less so that 3 lines of text will be allowed, OK?

Since this happens only when there is nothing on the page but the ‘top-box’, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

Here we need two page-ends since both columns need to be empty.

```
190 \ifdim \@colht<2.5\baselineskip
191   \@latex@warning@no@line {Optional argument of \noexpand\twocolumn
192     too tall on page \thepage}%
193   \emptycol
194   \if@firstcolumn
195   \else
196     \emptycol
197   \fi
198 \else
199   \global \vsize \@colht
200   \global \@colroom \@colht
201   \floatplacement
202 \fi
203 }
```

\output @specialoutput This needs some small adjustments. We cannot guarantee that the float mechanism will interact correctly with this stuff, but that mechanism does not always work properly with footnotes already.

RmS 91/09/29:

added reset of \par to the output routine. This avoids problems when the output routine is called within a list where \par may be a no-op.

```
204 \output {%
205   \let \par \@@par
206   \ifnum \outputpenalty<-\@M
207     \@specialoutput
208   \else
209     \makecol
210     \opcol
```

Moved to \opcol: \floatplacement.

```
211   \startcolumn
```

This loop could be replaced by an \expandafter tail recursion in \startcolumn.

```
212   \while{\if@fcolmade \fi}
213   {%
214     \tr@ce{PAGE: float \if@twocolumn column \else page \fi
215           completed}%
216   }
217 
```

```
218   \opcol\startcolumn}%
219 \fi
220 \ifnum \outputpenalty>-\@Mi
```

At points such as this we need to check that there is still a minimal amount of room left on the page; this uses an arbitrary small value at present. If there is little room left we just force a page-break, OK?

This bit is essential only if a float has just been processed so maybe it should be moved; but this is the natural place at which to set the vsize and a test would need to be done anyway. A check has been added to ensure that there really has been a change in the value of \colroom.

Since this happens only when there is nothing on the page but floats, the empty box should not cause any problem other than some overfull box messages, which is not entirely misleading.

The twocolumn case does not need any extra code here since this is the \output itself; in the second column there will still not be enough room left so \emptycol will be executed again when the OR is called by the-page builder when it gets to the penalty inserted by the first execution. (The page-builder is never invoked whilst the OR is being executed since it builds a inner vlist; thus any conditional code for the two-column case within \output may not get executed with the correct value of \if@firstcolumn.

```

221     \ifdim \@colroom<1.5\baselineskip
222         \ifdim \@colroom<\textheight
223             \@latex@warning{no@line {Text page \thepage\space
224                           contains only floats}%
225             \emptycol
226 %
227             \if@twocolumn
228             \if@firstcolumn

242 </2ekernel | autoload | ftrace>

```

CHANGES TO \specialoutput:

* \penalty\z@ changed to \penalty\interlinepenalty so \samepage works properly with figure and table environments.

(Changed 23 Oct 86)

* Definition of \specialoutput changed 26 Feb 88 so \pageht and \pagedp aren't changed for a marginal note.
(Change suggested by Chris Rowley.)

```

243 <*2ekernel | def1 | autoload | ftrace>
244 \gdef\@specialoutput{%
245     \ifnum \outputpenalty>-\@Mii
246         \@doclearpage
247     \else
248         \ifnum \outputpenalty<-\@Mii
249             \ifnum \outputpenalty<-\@MM \deadcycles \z@ \fi
250             \global \setbox\@holdpg \vbox {\unvbox\@cclv}%
251     \else

```

Note that \boxmaxdepth should not be set here since we wish to record the natural depth of the holdpg box.

This is changed so as to not lose anything, such as writes and marks, which may get into box 255 and should be returned to the list. This should only happen when the first penalty in the mechanism is discarded and therefore \@holdpg

should always be void in this case. This can happen because a penalty is discarded whenever there is no box on the list.

It was just: `\setbox\@tempboxa \box \cclv`.

The last box which is removed is the box put there by the double-penalty mechanism. The `\unskip` then removes the `\topskip` which is put there since the box is the first on the page.

```
252      \global \setbox\@holdpg \vbox{%
253          \unvbox\@holdpg
254          \unvbox\@cclv}
```

We must now remove the box added by the float mechanism and the `\topskip` glue therefore added above it by TeX.

```
255          \setbox\@tempboxa \lastbox
256          \unskip
257      }%
```

These two are needed as separate dimensions only by `\addmarginpar`; for other purposes we put the whole size into `\pageht` (see below).

```
258      \pagedp \dp\@holdpg
259      \pageht \ht\@holdpg
260      \unvbox \@holdpg
261      \next\currbox\currlist{%
262          \ifnum \count\currbox>z@
```

Putting the whole size into `\pageht` (see above).

```
263          \advance \pageht \pagedp
264          \ifvoid\footins \else
265              \advance \pageht \ht\footins
266              \advance \pageht \skip\footins
267              \advance \pageht \dp\footins
268          \fi
269 (*2ekernel | def1)
270          \ifvbox \kludgeins
```

We want to make the adjustment due to this insert only if the non-star form is used. The *-form will probably not work with floats, but maybe it still could make some adjustment here even so?

```
271          \ifdim \wd\kludgeins=z@
272          \advance \pageht \ht\kludgeins
273 (*trace)
274          \tr@ce {Extra size added: \the \ht\kludgeins}%
275 (/trace)
276          \fi
277          \fi
278 (/2ekernel | def1)
```

This version puts the inserts back just before the additional material; it could be moved earlier, before unboxing the page-so-far. Neither is guaranteed not to put things on the wrong page. This version is similar to the original version.

```
279          \reinserts
280          \addtocurcol
281          \else
282          \reinserts
283          \addmarginpar
284          \fi
```

```
285 } \@latexbug
```

A 2e change: use `\addpenalty` instead of `\penalty` here. Some penalty is needed to create a potential break-point immediately after the reinserts (or the marginal). Otherwise there can be no possibility to break here and this can cause the reinserts or the marginal to appear on the next page (which is often incorrect). However, if the `nobreak` flag is true, a `\nobreak` must be correct.

```
286     \ifnum \outputpenalty<\z@  
287         \if@nobreak  
288             \nobreak  
289         \else  
290             \addpenalty \interlinepenalty  
291         \fi  
292     \fi  
293     \fi  
294     \fi  
295 }  
296 </2ekernel | def1 | autoload | ftrace>
```

`\@doclearpage` This is a very much an emergency action, just dumping everything: footnotes first then floats. A more sophisticated version is needed; but even more urgent is a bug-free version (see, for example, pr/3528).

Also, it puts any left-over non-boxes (writes, specials, etc.) back after any float pages created: this is a very bad bug since, for example, a kludge insert will be in quite the wrong place and, worse, be irremovable and uncancelable.

```
297 <*2ekernel | autoload>  
298 \def \@doclearpage {  
299     \ifvoid\footins
```

We empty any left over kludge insert box here; this is a temporary fix. It should perhaps be applied to one page of cleared floats, but who cares? The whole of this stuff needs completely redoing for many such reasons.

```
300     \ifvbox\@kludgeins  
301         {\setbox \@tempboxa \box \@kludgeins} %  
302 <*trace>  
303         \tr@ce {\kludgeins box made void} %  
304 </trace>  
305     \fi  
306     \setbox\@tempboxa\vsplit\@cclv to\z@ \unvbox\@tempboxa

339 }
340 </2ekernel | autoload>

```

\@opcol Several changes in detail here.

```

341 <*2ekernel | autoload | fltrace>
342 \def \@opcol {%
343   \if@twocolumn
344     \outputdblcol
345   \else
346     \outputpage
347   <*trace>
348     \tr@ce{PAGE: one column (float? see above) page completed}%
349 </trace>

```

Not needed since it comes after \@outputpage:

```

350 %   \global\@colht\textheight
351   \fi

```

These do not need to be done every time \@opcol is used: they should be grouped together since they all need to be done at the end of the non-special output routine, or at the end of a clearpage one.

```

352   \global \mparbottom \z@ \global \textfloatsheight \z@
353   \floatplacement
354 }
355 </2ekernel | autoload | fltrace>

```

\@makecol We must rewrite this macro to allow for variations in page-makeup required by changes in page-length.

This uses a different macro if a special-length column is being produced.

```

356 <*2ekernel | def1 | autoload>
357 \gdef \@makecol {%
358   \ifvoid\footins
359     \setbox\outputbox \box\@cclv
360   \else
361     \setbox\outputbox \vbox {%

```

This `\boxmaxdepth` setting is to ensure that deep footnotes do not overwrite the footer (on account of the negative skip added later): it should use `\@maxdepth` otherwise the change is pointless when there are footnotes.

But see also its use when combining floats.

```

362      \boxmaxdepth \@maxdepth
363      \@tempdima\dp\@cclv
364      \unvbox \@cclv
365 %
366      \vskip-\@tempdima
367      \vskip \skip\footins
368      \color@begingroup
369      \normalcolor
370      \footnoterule
371      \unvbox \footins
372      \color@endgroup
373      }%
374      \fi

```

The h floats have now been finally committed to this page so we can reset their list. The top and bottom floats are then added to the page.

```

374      \let\@elt\relax
375      \xdef\@freelist{\@freelist\@midlist}%
376      \global \let \@midlist \empty
377      \@combinefloats

```

The variations start here in case `\enlargethispage` has been used.

```

378 {*2ekernel | def1}
379      \ifvbox\@kludgeins
380      \@makespecialcolbox
381      \else
382 /{2ekernel | def1}

```

This extra reboxing is only needed to add the `\@texttop` and `\@textbottom` but this could be done earlier, when the floats are added.

The `\boxmaxdepth` resetting here will have no effect unless `\@textbottom` ends with a box or rule. So is this (or possibly `\@maxdepth`) the correct value?

The `\vskip -\dimen@` ensures that the visible depth of the box does not affect the placement of anything on the page. Thus very deep pages will overprint the footer; but these should have been prevented by suitable settings of the maxdepths at appropriate times.

If `\@textbottom` ends with a box or rule of non-zero depth then this skip adjustemnt should be done again after it.

I think that the final boxing of the main text page could have a common ending which may make it simpler to see what is going on.

This needs further investigation, especially in the ‘special case’.

Also, the `\boxmaxdepth` setting here affects what happens wthin `\@texttop` and `\@textbottom`, should it? Is it needed at all?

RmS 91/10/22: Replaced `\dimen128` by `\dimen@`.

```

383      \setbox\@outputbox \vbox to\@colht {%
384 %      \boxmaxdepth \maxdepth %??
385      \@texttop
386      \dimen@ \dp\@outputbox

```

```

387      \unvbox \@outputbox
388      \vskip -\dimen@%
389      \@textbottom
390      }%
391 <*2ekernel | def1>
392     \fi
393 </2ekernel | def1>
394     \global \maxdepth \@maxdepth
395 }
396 </2ekernel | def1 | autoload>
```

\@reinserts This is the code which reinserts the inserts. It puts them all in one place; this can make some of them come out on the wrong page. It has been put into a separate macro to expedite experimentation.

```

397 <*2ekernel | def1 | autoload>
398 \gdef \@reinserts{%
399   \ifvoid\footins\else\insert\footins{\unvbox\footins}\fi
400 <+2ekernel | def1> \ifvbox\@kludgeins\insert\@kludgeins
401 <+2ekernel | def1>                                {\unvbox\@kludgeins}\fi
402 }
403 </2ekernel | def1 | autoload>
```

\@makespecialcolbox This implements certain variations in page-makeup.

```

404 <*2ekernel | def1 | fltrace>
405 \gdef \@makespecialcolbox {%
406 (*trace)
407   \tr@ce{Kludgeins ht \the\ht\@kludgeins\space
408           dp \the\dp\@kludgeins\space
409           wd \the\wd\@kludgeins}%
410 }/trace>
```

First we find the natural height of the column.

See above for discussion of what is happening here.

This needs further investigation, especially in this ‘special case’.

```

411   \setbox\@outputbox \vbox {%
412     \@texttop
413     \dimen@ \dp\@outputbox
414     \unvbox\@outputbox
415     \vskip-\dimen@
416   }%
417   \tempdima \colht
418   \ifdim \wd\@kludgeins>\z@
```

Note that in this case (the *-version), the height of the \@kludgeins box is not used since its value is somewhat arbitrary: it need only be big enough to ensure that the page-break is not taken prematurely.

Here we calculate how much vertical space needs to be added in order to enable the column to fit into a box of size \colht using the best information we have about the amount of shrink available (another thing which is known internally about a box, but cannot be accessed at the TeX level!).

This needs TeX3 otherwise \pageshrink is zero anyway; it may not be exactly the figure we wish as it is the total available from all the material collected before the page-break decision is made. It will, we think, always be an overestimate

of the actual shrink in the box; therefore this should always force the shortest possible column with the possibility of an overfull box.

This should work for both the flush- and ragged-bottom setting since it makes the contents no smaller than the size (`\@colht`) of the box into which they are put.

There should perhaps be an upper limit, of 0pt?, on the extra space added to force shrinking.

See above for a discussion of the `\boxmaxdepth` setting here.

```

419      \advance \@tempdima -\ht\@outputbox
420      \advance \@tempdima \pageshrink
421 (*trace)
422      \tr@ce {Natural ht of col: \the \ht\@outputbox}%
423      \tr@ce {\string \@colht: \the \@colht}%
424      \tr@ce {Pageshrink added: \the \pageshrink}%
425      \tr@ce {Hence, space added: \the \@tempdima}%
426 (/trace)
427      \setbox\@outputbox \vbox to \@colht {%
428 %          \boxmaxdepth \maxdepth
429      \unvbox\@outputbox
430      \vskip \@tempdima
431      \textbottom
432      }%

```

For the unstarred version, the final size of the page is precisely specified. Therefore, at least for the flush-bottom case, we need to ensure that, visually, it has this size exactly.

Thus we calculate this size and set the material in a box of this size, which is then put into a box of size `\@colht` with `\vss` at the bottom.

```

433 \else
434     \advance \@tempdima -\ht\@kludgeins
435 (*trace)
436     \tr@ce {Natural ht of col: \the \ht\@outputbox}%
437     \tr@ce {\string \@colht: \the \@colht}%
438     \tr@ce {Extra size added: -\the \ht \@kludgeins}%
439     \tr@ce {Hence, height of inner box: \the \@tempdima}%
440     \tr@ce {Max? pageshrink available: \the \pageshrink}%
441 (/trace)

```

This type of final packaging could be done always; this may simplify all of this page-makeup.

It is not necessary to set `\boxmaxdepth` here since the `\@outputbox` ends with glue.

```

442     \setbox \@outputbox \vbox to \@colht {%
443         \vbox to \@tempdima {%
444             \unvbox\@outputbox
445             \textbottom}%
446         \vss}%
447     \fi

```

Finally we need to explicitly make the insert box void.

```

448     {\setbox \@tempboxa \box \@kludgeins}%
449 (*trace)
450     \tr@ce {kludgeins box made void}%

```

```

451 </trace>
452 }
453 </2ekernel | def1 | fltrace>

\@texttop These do nothing as a default.

\@textbottom 454 (*2ekernel | autoload)
455 \let \@texttop \relax
456 \let \@textbottom \relax

\@resetactivechars RmS 93/09/06: added hook to protect against certain active characters in the
\@activechar@info output routine. Default checks are for active space and end-of-line.

457 \def\@activechar@info #1{%
458     \@latex@info@no@line {Active #1 character found while
459                             output routine is active

471 \endgroup

\@outputpage \@shipoutsetup \@writesetup The \color@hbox hooks here are used to avoid putting just a colour special into
an otherwise empty box (in a header or footer). These boxes are often set to be
completely empty and so adding a special produces a very underfull box message.

There has been extensive tidying up of the old code here; including the removal
of a level of grouping.

The setting of \protect immediately before the \shipout is needed so that
protected commands within \writes are handled correctly.

Within shipout's vbox it is reset to its default value, \relax.

Resetting it to its default value after the shipout has been completed (and the
contents of the writes have been expanded) must be done by use of \aftergroup.
This is because it must have the value \relax before macros coming from other
uses of \aftergroup within this box are expanded.

Putting this into the \aftergroup token list does not affect the definition
used in expanding the \writes because the aftergroup token list is only con-
structed when popping the save-stack, it is not expanded until after the shipout
is completed.

Question: should things from an \aftergroup within the shipped out box be
executed in the environment set up for the writes, or after it finishes?

A lot of this code has been in-lined to prevent mis-use of internal commands
as hooks.

472 \def\@outputpage{%
473 \begingroup % the \endgroup is put in by \aftergroup

```

Now all the set-up stuff has been in-lined for Frank.

First the stuff for the writes.

From here ... was in the command \@writesetup.

474 \let \protect \noexpand

RmS 93/08/19: Redefined accents to allow changes in font encoding; but exactly why was this needed?

The \catcode`\ = 10 was removed as it was considered useless (presumably because nothing gets tokenised during shipout).

This was put in as some error produced active spaces in a mark, I think.

Why was the hyphen reset?

475 \@resetactivechars

If a page break happens between the start of a list and its first item the @newlist will be true and this will mess up any list that is used in the header or footer of the page. So we have to reset that flag.

476 \global\let\@@if@newlist\if@newlist

477 \global\@newlistfalse

This next hook replaces the following:

```
\let\-\@dischyp  
\let'\@acci\let`\'@acci\let`=\@acci  
\let\\@\normalcr  
\let\par\@par %% 15 Sep 87 (this was once inside the box)
```

and it does more than they did; in particular it sets:

```
\parindent\z@  
\parskip\z@skip  
\everypar{}%  
\leftskip\z@skip  
\rightskip\z@skip  
\parfillskip\@flushglue  
\lineskip\normalineskip  
\baselineskip\normalbaselineskip  
\sloppy
```

478 \@parboxrestore

... to here was in the command \@writesetup.

479 \shipout \vbox{%

480 \set@typeset@protect

481 \aftergroup \endgroup

482 \aftergroup \set@typeset@protect

483 % correct? or just restore by ending

484 % the group?

This first bit has been moved inside the shipped out box.

Now the setup inside the shipped out box; this should contain all the stuff that could only affect typesetting; other stuff may need to be reset for the writes also.

From here ... was in the command \@shipoutsetup.

485 \if@specialpage

486 \global\@specialpagefalse\@nameuse{ps@\@specialstyle}%%

```

487   \fi
488   \if@twoside
489     \ifodd\count\z@ \let\@thehead\@oddhead \let\@thefoot\@oddfoot
490       \let\@themargin\oddsidemargin

886 </trace>
    CHANGE TO \@addtocurcol:
    \penalty\z@ changed to \penalty\interlinepenalty so \samepage works
properly with figure and table environments. (Changed 23 Oct 86)
    There is also an \addpenalty\interlinepenalty above.
    Since in 2e \samepage is no longer supported, these could be removed.
    Although it is best to use \addvspace in case two h floats come together, this
makes other spacing more difficult to adjust; whereas if a user specifies two h floats
together then they can more easily get the spacing correct by ad hoc commands.
    It is necessary to adjust for the addition of \parskip here in case the float is
added between paragraphs (i.e. when in vertical mode).
    If the nobreak switch is true we need to reset it and clear \everypar since
the float may not reset the flag and cannot reset the \everypar globally.
    Typesetting starts here (we are in vertical mode).
887           \if@nobreak
888             \nobreak
889             \c@nobreakfalse

1186      \fi
1187      \box\c@marbox \hss}%

```

For this reason the following code can vanish:

```

\nobreak           %% No longer needed.  CAR92/12
\vskip -\tempdima %% No longer needed.  CAR92/12

1188   \nointerlineskip
1189   \hbox{\vrule \height\z@ \width\z@ \depth\c@pagedp}}
1190 {/2ekernel | autoload}

```

66.1.1 Kludgeins

This part of the file is part of the implementation of the following two new commands for L^AT_EX2e.

```
\enlargethispage{<dim>}
```

Adds *<dim>* to the height of the current column only. On the printed page the bottom of this column is extended downwards by exactly *<dim>* without having any effect on the placement of the footer; this may result in an overprinting.

```
\enlargethispage*{<dim>}
```

Similar to `\enlargethispage` but it tries to squeeze the column to be printed in as small a space as possible, ie it uses any shrinkability in the column. If the column was not explicitly broken (e.g. with `\pagebreak`) this may result in an overfull box message but except for this it will come out as expected (if you know what to expect).

The star form of this command is dedicated to Leslie Lamport, the other we need for ourselves (FMi, CAR).

These commands may well have unwanted effects if used soon before a

: please give keep them clear of such places.

\@kludgeins The insert which makes TeX do a lot of the necessary work. All we need to put into it is the amount by which the pagegoal should be changed.

```
1191 <*2ekernel | def1>
1192 \newinsert \@kludgeins
1193 \global\dimen \@kludgeins \maxdimen
1194 \global\count \@kludgeins 1000
1195 </2ekernel | def1>
```

\enlargethispage The user command.

```
\enlargethispage* 1196 <*2ekernel | def1>
1197 \gdef \enlargethispage {%
1198     \@ifstar

1240      \fi
1241  \fi
1242 〉
1243 〈/2ekernel | def1〉

```

66.1.2 Float control

This part implements controllable floats and other changes to the float mechanism.

It provides, at the document level, the following command for inclusion in L^AT_EX2e.

```
\suppressfloats
```

This suppresses all further floats on the current page.

With an optional argument it suppresses only floats only in certain positions on the current page.

[t] suppresses only floats at the top of the page [b] suppresses only floats at the bottom of the page

It also enables the use of an extra specifier, !, in the location optional argument of a float. If this is present then, just for this particular float, whenever it is processed by the float mechanism the followinhg are ignored:

- all restrictions on the number of floats which can appear;
- all explicit restrictions on the amount of space which should (not) be occupied by floats and/or text.

The mechanism will still attempt to ensure that pages are not overfull.

These specifiers override, for the single float, the suppression commands described above.

In its current form, it also suplies a reasonably exhaustive, and somewhat baroque, means of tracing some aspects of the float mechanism.

More tracing.

```

\tr@ce Set-up tracing for floats independent of other tracing as it produces mega-output.
\notrace Default is no tracing.

\tracefloats 1244 (*trace)
  \@traceval 1245 \def \@tracemessage #1{\typeout{LaTeX2e: #1}}

1262   \@traceval\@dbltoproom
1263 }
1264 </trace>
1265 {*flafter}
1266 \providecommand\tr@ce[1]{}
1267 </flafter>

```

\suppressfloats Float suppression commands: these set the relevant counter globally to zero. Thus
\@flstop they are overridden for a particular float by an ! specifier.

```

1268 {*2ekernel | autoload}
1269 \def \suppressfloats {%
1270   \@ifnextchar [%
1271     \@flstop
1272   {\global \@colnum \z@}%
1273 }

```

Maybe this should be a loop over #1?

```

1274 \def \@flstop [#1]{%
1275   \if t#1%
1276     \global \@topnum \z@
1277   \fi
1278   \if b#1%
1279     \global \@botnum \z@
1280   \fi
1281 }

```

Manipulation of float placement and type; both their strings and the corresponding count registers.

\@fpstype First a new count register to go with \currtype.
\@reqcolroom Then a new skip register, for information needed to remove the \maxsep
\@textfloatsheight conservatism: it is possible that this could use a temporary register.
Finally a dimension register to hold the total height of in-text floats on the current page. This is needed to implement a major change in the functionality of \addtocurcol which is, nevertheless, a bug fix. It is not local and therefore cannot be a temporary register.

```

1282 \newcount \@fpstype
1283 \newdimen \@reqcolroom
1284 \newdimen \@textfloatsheight
1285 </2ekernel | autoload>

```

\@fpsadddefault Adds the default placement to what is already there.
Should not need to change this, but could do it as follows:

```

\def \@fpsadddefault {%
  \@tempokena \expandafter\expandafter\expandafter

```

```

    {\csname fps@\@capttype \endcsname}%
\edef \reserved@a {\the\@temptokena}%
\onelevel@sanitize \reserved@a
\edef \@fps {\@fps\reserved@a}%
}

1286 {*2ekernel | autoload | fltrace}
1287 \def \@fpsadddefault {%
1288 (*trace)
1289   \tr@ce{fps changed from: \@fps}%
1290 
1291   \edef \@fps {\@fps\csname fps@\@capttype \endcsname}%
1292   \@latex@warning {%
1293     No positions in optional float specifier.\MessageBreak
1294     Default added (so using '\@fps')}%
1295 }

```

\@setfloattypecounts Sets counters \@fpstype and \@currtype.
BANG == bit4 of \count\@currbox = 0.

```

1296 \def \@setfloattypecounts {%
1297   \@currtype \count\@currbox

1360 <trace>
1361   \tr@ce{%
1362     't' added to '\reserved@a h'- new Count: \the \count\currbox}%
1363 </trace>
1364   \fi
1365 }
```

Special stuff for BANG floats.

\@flsetnum Ignores any zero float counter value in case BANG.

It uses a local assignment to the normally global counter: a bit naughty, perhaps?

These assignments are safe so long as the counter involved is only consulted once (i.e. only for the ‘bang float’) with the changed value. This is the case within \@addtocurcol because it is used only once within a call of the output routine (which forms a group).

For \@addtonextcol this is achieved by putting a group around its code; this is needed because it is called (by \@startcolumn) for each float which was on the deferlist. Almost identical considerations pertain to \@addtobblcol. There may be more efficient ways to handle this, but the group seems to be the simplest.

```
1366 \def \@flsetnum #1{%
1367   {*trace}
1368   \tr@ce{fpstype: \the \@fpstype (flsetnum \string#1)}%
1369   {/trace}
1370   \ifnum \@fpstype<\sixt@n
1371     \ifnum #1=\z@
1372     {*trace}
1373       \tr@ce{BANG float resetting \string#1 to 1}%
1374     {/trace}
1375     #1\@ne
1376   \fi
1377   \fi
1378   {*trace}
1379   \tr@ce{\#1 (before) = \the #1}%
1380 {/trace}
1381 }
```

\@flsettextmin This ignores \textfraction space restriction in case BANG.

```
1382 \def \@flsettextmin {%
1383   {*trace}
1384   \tr@ce{fpstype: \the \@fpstype (flsettextmin)}%

Interesting facts about float mechanisms past and present, together with a summary of various features, some unresolved:

1. The value `\textfraction` does not affect the processing of doublecol floats: this seems sensible, but should be documented.
2. `\twocolumn` floatplacement was wrong: dbl not needed, ord needed.
3. `\@floatplacement` was not called after `\@startdblcol` or `\@topnewpage`. This has been changed; it is clearly a bug fix.
4. The use `\@topnewpage` when `\dblfigrule` is non-trivial produced a rule in the wrong place. This has been fixed by not using `\dblfigrule` when processing the ‘float’ from `\@topnewpage`.
5. If the specifier was just `h` and the float could not be put here, it went on the deferlist and stayed there until a clearpage. It now gets changed to a ‘`th`’: this is only an error-recovery action, putting just `h` or `!h` should be deprecated.
6. `\@dblmaxsep` was ‘the maximum of `\dblfloatesep` and `\dbltextfloatsep`’. But it was never used! Now gone completely, like `\@maxsep`.
7. After an `h` float is put on a page, it was counted as text when applying the `\textfraction` test; this is possibly too big a change although it is a bug fix?
8. Two consecutive `h` floats are separated by twice `\intextsep`: this could be changed to one by use of `\addvspace`, OK? Note that it would also mean that less space is put in if an `h` float immediately follows other spaces. This is also possibly too big a change, at least for compatibility mode? Or it may be simply wrong! It has not been changed.
9. Now `\@addtocurcol` checks first for just `p` fps. I think that this is an increase in efficiency, but maybe the coding should be made even more efficient.
10. `\@tryfcolumn` now tests if the list is empty first, otherwise lots of wasted time! Thus this test has been removed from `\@startcolumn`. As Frank pointed out, this makes `\@startcolumn` less efficient. But it is now the same as `\@startdblcolumn`: I can see no reason why they should be different, but which is best?
11. Why is `\@colroom` set in `\@doclearpage`?
12. Footnotes. Check what `\clearpage` does when footnotes are left over. Footnotes are not put on float pages and, also, `\@addtonextcol` ignores the existence of held-over footnotes in deciding what floats can go on the page. Not changed.
13. `\clearpage` can still lose non-boxes, at least when floats are involved. It also moves some to the ‘wrong page’, but this may be a coding problem.

14. The ! option makes it necessary to check in `\output` that there is enough room left on the page after adding a float. (This would have been necessary anyway if anyone set `\@textmin` too close to zero! A similar danger existed also if the text in a `\twocolumn[text]` entity gets too large.) The current implementation of this also makes the normal case a little less efficient, OK? Not enough room means, at present, less than `\baselineskip`, with a warning: is this OK? Should it be made generic (another parameter)?
15. There are four possibilities for supporting this:

```
\twocolumn[\maketitle more text]
```

One is to change `\maketitle` slightly to allow this. Another is to change `\@topnewpage` so that more than one `\twocolumn[]` command is allowed; in this case `\maketitle\twocolumn[more text]` will work. The former is more robust from the user's viewpoint, but makes the code for `\maketitle` rather ad hoc (maybe it is already?). Another is to misuse the global `twocolumn` flag locally within `\@topnewpage`. Yet another is to move the column count register from the `multicol` package into the kernel. This has beeen done.
16. Where should the reinserts be put to maximise the probability that footnotes come out on the correct page? Or should we go for as much compatibility as possible (but see next item)?
17. Should we continue to support (as much as possible) `\samepage`? Some of its intended functionality is now advertised as being provided by `\enlargethispage`. Use of either is likely to result in wrongly placed footnotes, marginals, etc. Which should have priority: obeying the pagination instructions, or correct placement of notes/marginalia?
18. Is the adjustment of space to cause shrinking in the kludge-* case correct? Should it be limited to 0pt?
19. Is the setting of `\boxmaxdepth` in `makecol` and friends needed? It only has any effect if `\@textbottom` ends with a box or rule, in which case the vskip to allow for its depth should also be added. If it is kept, it should probably be the last thing in the box. It has now been removed.
It would perhaps be better to document that `\@textbottom` and `\@texttop` must have natural height 0pt.
20. I cannot see why the vskip adjustement for the depth is needed if `boxmaxdepth` is used to ensure that there is never a too deep box.
21. The value of `\boxmaxdepth` should be explicitly set whenever necessary: it is too risky to assume that it has any particular value. Care is needed in deciding what to set it to.
It is interesting to note that the value of `\boxmaxdepth` is unique in being read before the local settings for the box group are reset; all other parameter settings which affect the box construction use their values outside the box group.
22. Should `\@maxdepth` store the setting of `\maxdepth` from `lplain`? Or should we provide a proper interface to class files for setting these?

An analysis of various other macros.

\opcol should do \floatplacement, but where? Right at the end, since it always occurs at the start of a column.

```
\def\@opcol{%
  % Why is this done first?
  \global \z@\@parbottom \z@
  \if@twocolumn
    \outputdblcol
  \else
    \outputpage
    % This is not needed since it is done at the end of
    % |\outputpage|:
    \global \colht \textheight
  \fi}
```

Only tracing has been added to these.

```
1455 <*2ekernel | autoload | fltrace>
1456 \def\@makefcolumn #1{%
1457   \begingroup
1458   \fpmin \z@
1459   \let \testfp \gobble
1460   \tryfcolumn #1%
1461   \endgroup
1462 <*trace>
1463   \if@fcolmade
1464     \tr@ce{PAGE: in \string\clearpage \if@twocolumn ---twocolumn\fi---}%
1465     \tr@ce{----- float column/page completed from \string#1}%
1466   \fi
1467 </trace>
1468 }
```

This will line up the last baselines in the two columns provided they are constructed in the normal way: i.e. ending in a skip of minus the original depth, with \textbottom adding nothing.

Thus again it is essential for \textbottom to have depth 0pt.

```
1469 \def\@outputdblcol{%

66.1.3 Float placement parameters

The main purpose of this section is to ensure that all the float-placement parameters which need to be set in a class file or package have been declared. It also describes their use and sets values for them which are reasonable for typical documents using US letter or A4 sized paper.

Limits for the placement of floating objects

- \c@topnumber This counter holds the maximum number of floats that can appear at the top of a text page or column.

```

1510 <*2ekernel | autoload>
1511 \newcount\c@topnumber
1512 \setcounter{topnumber}{2}

```
- \topfraction This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the top.

```

1513 \newcommand\topfraction{.7}

```
- \c@bottomnumber This counter holds the maximum number of floats that can appear at the bottom of a text page or column.

```

1514 \newcount\c@bottomnumber
1515 \setcounter{bottomnumber}{1}

```

- \bottomfraction** This macro holds the maximum proportion (as a decimal number) of a text page or column that can be occupied by floats at the bottom.
- ```
1516 \newcommand{\bottomfraction}{.3}
```
- \c@totalnumber** This counter holds the maximum number of floats that can appear on any text page or column.
- ```
1517 \newcount\c@totalnumber
1518 \setcounter{totalnumber}{3}
```
- \textfraction** This macro holds the minimum proportion (as a decimal number) of a text page or column that must be occupied by text.
- ```
1519 \newcommand{\textfraction}{.2}
```
- \floatpagefraction** This macro holds the minimum proportion (as a decimal number) of a page or column that must be occupied by floating objects before a ‘float page’ is produced.
- ```
1520 \newcommand{\floatpagefraction}{.5}
```
- \c@dbltopnumber** This counter holds the maximum number of double-column floats that can appear on the top of a two-column text page.
- ```
1521 \newcount\c@dbltopnumber
1522 \setcounter{dbltopnumber}{2}
```
- \dbltopfraction** This macro holds the maximum proportion (as a decimal number) of a two-column text page that can be occupied by double-column floats at the top.
- ```
1523 \newcommand{\dbltopfraction}{.7}
```
- \dblfloatpagefraction** This macro holds the minimum proportion (as a decimal number) of a page that must be occupied by double-column floating objects before a ‘double-column float page’ is produced.
- ```
1524 \newcommand{\dblfloatpagefraction}{.5}
```

### Floats on a text page

**\floatsep** When a floating object is placed on a page with text, these parameters control the separation between the float and the other objects on the page. These parameters are used for both one-column mode and single-column floats in two-column mode. They are all rubber lengths.

**\floatsep** is the space between adjacent floats that are placed at the top or bottom of the text page or column.

**\textfloatsep** is the space between the main text and floats at the top or bottom of the page or column.

**\intextsep** is the space between in-text floats and the text.

- ```
1525 \newskip\floatsep
1526 \newskip\textfloatsep
1527 \newskip\intextsep
1528 \setlength\floatsep {12\p@ \oplus 2\p@ \minus 2\p@}
1529 \setlength\textfloatsep{20\p@ \oplus 2\p@ \minus 4\p@}
1530 \setlength\intextsep {12\p@ \oplus 2\p@ \minus 2\p@}
```

\dblfloatsep When double-column floats (floating objects that span the whole `\textwidth`) are placed at the top of a text page in two-column mode, the separation between the float and the text is controlled by `\dblfloatsep` and `\dbltextfloatsep`. They are rubber lengths.

`\dblfloatsep` is the space between adjacent double-column floats placed at the top of the text page.

`\dbltextfloatsep` is the space between the main text and double-column floats at the top of the page.

```
1531 \newskip\ dblfloatsep  
1532 \newskip\ dbltextfloatsep  
1533 \setlength\ dblfloatsep{12\p@ \oplus 2\p@ \ominus 2\p@}  
1534 \setlength\ dbltextfloatsep{20\p@ \oplus 2\p@ \ominus 4\p@}
```

Flosts on their own page or column

\@fptop When floating objects are placed on a seperate page or column, called a ‘float page’, the layout of the page is controlled by these parameters, which are rubber lengths.

At the top of the page `\@fptop` is inserted; typically this supplies some stretchable whitespace. At the bottom of the page `\@fpbot` is inserted. Between adjacent floats `\@fpsep` is inserted.

These parameters are used for all floating objects on a ‘float page’ in one-column mode, and for single-column floats in two-column mode.

Note that at least one of the two parameters `\@fptop` and `\@fpbot` should contain a `plus ... fil` so as to fill the remaining empty space.

```
1535 \newskip\@fptop  
1536 \newskip\@fpsep  
1537 \newskip\@fpbot  
1538 \setlength\@fptop{0\p@ \oplus 1fil}  
1539 \setlength\@fpsep{8\p@ \oplus 2fil}  
1540 \setlength\@fpbot{0\p@ \oplus 1fil}
```

\@dblfpptop Double-column ‘float pages’ in two-column mode use similar parameters.

```
\@dblfpsep 1541 \newskip\@dblfpptop  
\@dblfpbot 1542 \newskip\@dblfpsep  
1543 \newskip\@dblfpbot  
1544 \setlength\@dblfpptop{0\p@ \oplus 1fil}  
1545 \setlength\@dblfpsep{8\p@ \oplus 2fil}  
1546 \setlength\@dblfpbot{0\p@ \oplus 1fil}
```

\topfigrule The macros can be used to put in rules between floats and text; whatever they **\botfigrule** insert should be vertical mode material which takes up zero space.

```
\dblfigrule 1547 \let\topfigrule=\relax  
1548 \let\botfigrule=\relax  
1549 \let\dblfigrule=\relax  
1550 </2ekernel | autoload>
```

File L

ltclass.dtx

67 Introduction

This file implements the following declarations, which replace `\documentstyle` in L^AT_EX 2_E documents.

Note that old documents containing `\documentstyle` will be run using a compatibility option—thus keeping everyone happy, we hope!

The overall idea is that there are two types of ‘style files’: ‘class files’ which define elements and provide a default formatting for them; and ‘packages’ which provide extra functionality. One difference between L^AT_EX 2_E and L^AT_EX 2.09 is that L^AT_EX 2_E packages may have options. Note that options to classes packages may be implemented such that they input files, but these file names are not necessarily directly related to the option name.

68 User interface

```
\documentclass[<main-option-list>]{<class>}[<version>]
```

There must be exactly one such declaration, and it must come first. The `<main-option-list>` is a list of options which can modify the formatting of elements which are defined in the `<class>` file as well as in all following `\usepackage` declarations (see below). The `<version>` is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the class is found, a warning is issued.

```
\documentstyle[<main-option-list>]{<class>}[<version>]
```

The `\documentstyle` declaration is kept in order to maintain upward compatibility with L^AT_EX 2.09 documents. It is similar to `\documentclass`, but it causes all options in `<main-option-list>` that the `<class>` does not use to be passed to `\RequirePackage` after the options have been processed. This maintains compatibility with the 2.09 behaviour. Also a flag is set to indicate that the document is to be processed in L^AT_EX 2.09 compatibility mode. As far as most packages are concerned, this only affects the warnings and errors L^AT_EX generates. This flag does affect the definition of font commands, and `\sloppy`.

```
\usepackage[<package-option-list>]{<package-list>}[<version>]
```

There can be any number of these declarations. All packages in `<package-list>` are called with the same options.

Each `<package>` file defines new elements (or modifies those defined in the `<class>`), and thus extends the range of documents which can be processed. The `<package-option-list>` is a list of options which can modify the formatting of elements defined in the `<package>` file. The `<version>` is a version number, beginning with a date in the format YYYY/MM/DD. If an older version of the package is found, a warning is issued.

Each package is loaded only once. If the same package is requested more than once, nothing happens, unless the package has been requested with options that were not given the first time it was loaded, in which case an error is produced.

As well as processing the options given in the $\langle package-option-list \rangle$, each package processes the $\langle main-option-list \rangle$. This means that options that affect all of the packages can be given globally, rather than repeated for every package.

filecontents Note that class files have the extension `.cls`, packages have the extension `.sty`.

The environment `filecontents` is intended for passing the contents of packages, options, or other files along with a document in a single file. It has one argument, which is the name of the file to create. If that file already exists (maybe only in the current directory if the OS supports a notion of a ‘current directory’ or ‘default directory’) then nothing happens (except for an information message) and the body of the environment is bypassed. Otherwise, the body of the environment is written verbatim to the file name given as the first argument, together with some comments about how it was produced.

The environment is allowed only before `\documentclass` to ensure that all packages or options necessary for this particular run are present when needed. The begin and end tags should each be on a line by itself. There is also a star-form; this does not write extra comments into the file.

68.1 Option processing

When the options are processed, they are divided into two types: *local* and *global*:

- For a class, the options in the `\documentclass` command are local.
- For a package, the options in the `\usepackage` command are local, and the options in the `\documentclass` command are global.

The options for `\documentclass` and `\usepackage` are processed in the following way:

1. The local and global options that have been declared (using `\DeclareOption` as described below) are processed first.

In the case of `\ProcessOptions`, they are processed in the order that they were declared in the class or package.

In the case of `\ProcessOptions*`, they are processed in the order that they appear in the option-lists. First the global options, and then the local ones.

2. Any remaining local options are dealt with using the default option (declared using the `\DeclareOption*` declaration described below). For document classes, this usually does nothing, but records the option on a list of unused options. For packages, this usually produces an error.

Finally, when `\begin{document}` is reached, if there are any global options which have not been used by either the class or any package, the system will produce a warning.

69 Class and Package interface

69.1 Class name and version

\ProvidesClass A class can identify itself with the `\ProvidesClass{\langle name \rangle}[\langle version \rangle]` command. The $\langle version \rangle$ should begin with a date in the format YYYY/MM/DD.

69.2 Package name and version

\ProvidesPackage A package can identify itself with the \ProvidesPackage{\langle name\rangle}[\langle version\rangle] command. The \langle version\rangle should begin with a date in the format YYYY/MM/DD.

69.3 Requiring other packages

\RequirePackage Packages or classes can load other packages using \RequirePackage[\langle options\rangle]{\langle name\rangle}[\langle version\rangle].

If the package has already been loaded, then nothing happens unless the requested options are not a subset of the options with which it was loaded, in which case an error is called.

\LoadClass Similar to \RequirePackage, but for classes, may not be used in package files.

\PassOptionsToPackage Packages can pass options to other packages using:

\PassOptionsToPackage{\langle options\rangle}{\langle package\rangle}.

This adds the \langle options\rangle to the options list of any future \RequirePackage or \usepackage command. For example:

```
\PassOptionsToPackage{foo,bar}{fred}
\RequirePackage[baz]{fred}
```

is the same as:

```
\RequirePackage[foo,bar,baz]{fred}
```

\LoadClassWithOptions \LoadClassWithOptions{\langle name\rangle}[\langle version\rangle]:

This is similar to \LoadClass, but it always calls class \langle name\rangle with exactly the same option list that is being used by the current class, rather than an option explicitly supplied or passed on by \PassOptionsToClass. \RequirePackageWithOptions is the analogous command for packages.

This is mainly intended to allow one class to simply build on another, for example:

```
\LoadClassWithOptions{article}
```

This should be contrasted with the slightly different construction

```
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

As used here, the effects are more or less the same, but the version using \LoadClassWithOptions is slightly quicker (and less to type). If, however, the class declares options of its own then the two constructions are different; compare, for example:

```
\DeclareOption{landscape}{...}
\ProcessOptions
\LoadClassWithOptions{article}
```

with:

```
\DeclareOption{landscape}{...}
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
\ProcessOptions
\LoadClass{article}
```

In the first case, the `article` class will be called with option `landscape` precisely when the current class is called with this option; but in the second example it will not as in that case `article` is only passed options by the default option handler, which is not used for `landscape` as that option is explicitly declared.

```
\@ifpackageloaded
  \@ifclassloaded
\@ifpackagelater
  \@ifclasslater
\@ifpackagewith
  \@ifclasswith
```

To find out if a package has already been loaded, use

`\@ifpackageloaded{<package>}{{true}}{{false}}`.

To find out if a package has already been loaded with a version more recent than `<version>`, use `\@ifpackagelater{<package>}{{version}}{{true}}{{false}}`.

To find out if a package has already been loaded with at least the options `<options>`, use `\@ifpackagewith{<package>}{{options}}{{true}}{{false}}`.

There exists one package that can't be tested with the above commands: the `fontenc` package pretends that it was never loaded to allow for repeated reloading with different options (see `ltoutenc.dtx` for details).

69.4 Declaring new options

Options for classes and packages are built using the same macros.

```
\DeclareOption
\DeclareOption*
```

To define a builtin option, use `\DeclareOption{<name>}{{code}}`.

To define the default action to perform for local options which have not been declared, use `\DeclareOption*{{code}}`.

Note: there should be no use of

`\RequirePackage`, `\DeclareOption`, `\DeclareOption*` or `\ProcessOptions` inside `\DeclareOption` or `\DeclareOption*`.

Possible uses for `\DeclareOption*` include:

`\DeclareOption*{}`

Do nothing. Silently accept unknown options. (This suppresses the usual warnings.)

`\DeclareOption*{\@unkownoptionerror}`

Complain about unknown local options. (The initial setting for package files.)

`\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{<pkg-name>}}`

Handle the the current option by passing it on to the package `<pkg-name>`, which will presumably be loaded via `\RequirePackage` later in the file. This is useful for building ‘extension’ packages, that perhaps handle a couple of new options, but then pass everything else on to an existing package.

`\DeclareOption*{\InputIfFileExists{xx-\CurrentOption.yyy}{}%`

`{}}`

`{\OptionNotUsed}}`

Handle the option `foo` by loading the file `xx-foo.yyy` if it exists, otherwise do nothing, but declare that the option was not used. Actually the `\OptionNotUsed` declaration is only needed if this is being used in class files, but does no harm in package files.

69.5 Safe Input Macros

```
\InputIfFileExists \InputIfFileExists{<file>}{{then}}{{else}}
Inputs <file> if it exists. Immediately before the input, <then> is executed. Otherwise <else> is executed.
\IfExists As above, but does not input the file.
One thing you might like to put in the <else> clause is
\@missingfileerror This starts an interactive request for a filename, supplying default extensions.
```

Just hitting return causes the whole input to be skipped and entering x quits the current run,

`\input` This has been redefined from the L^AT_EX2.09 definition, in terms of the new commands `\InputIfFileExists` and `\@missingfileerror`.

`\listfiles` Giving this declaration in the preamble causes a list of all files input via the ‘safe input’ commands to be listed at the end. Any strings specified in the optional argument to `\ProvidesPackage` are listed alongside the file name. So files in standard (and other non-standard) distributions can put informative strings in this argument.

70 Implementation

1 `(*2ekernel)`

`\if@compatibility` The flag for compatibility mode.

2 `\newif\if@compatibility`

`\@documentclasshook` The hook called after the first `\documentclass` command. By default this checks to see if `\@normalsize` is undefined, and if so, sets it to `\normalsize`.

```
3 \def\@documentclasshook{%
4   \ifx\@normalsize\@undefined
5     \let\@normalsize\normalsize
6   \fi
7 }
```

`\@declaredoptions` This list is automatically built by `\DeclareOption`. It is the list of options (separated by commas) declared in the class or package file and it defines the order in which the the corresponding `\ds@<option>` commands are executed. All local `<option>`s which are not declared will be processed in the order defined by the optional argument of `\documentclass` or `\usepackage`.

8 `\let\@declaredoptions\@empty`

`\@classoptionslist` List of options of the main class.

```
9 \let\@classoptionslist\relax
10 \onlypreamble\@classoptionslist
```

`\@unusedoptionlist` List of options of the main class that haven’t been declared or loaded as class option files.

```
11 \let\@unusedoptionlist\@empty
12 \onlypreamble\@unusedoptionlist
```

`\CurrentOption` Name of current package or option.

13 `\let\CurrentOption\@empty`

`\@currname` Name of current package or option.

14 `\let\@currname\@empty`

`\@currext` The current file extension.

15 `\global\let\@currext=\@empty`

```

\@clsextension The two possible values of \@currext.
\@pkgextension 16 \def\@clsextension{cls}
                17 \def\@pkgextension{sty}
                18 \onlypreamble\@clsextension

142 \onlypreamble\OptionNotUsed

```

\default@ds The default default option code. Set by `\onefilewithoptions` to either `\OptionNotUsed` for classes, or `\unknownonerror` for packages. This may be reset in either case with `\DeclareOption*`.

```
143 % \let\default@ds\OptionNotUsed
```

\ProcessOptions `\ProcessOptions` calls `\ds@option` for each known package option, then calls `\default@ds` for each option on the local options list. Finally resets all the declared options to `\relax`. The empty option does nothing, this has to be reset on the off chance it's set to `\relax` if an empty element gets into the `\@declaredoptions` list.

The star form is similar but executes options given in the order specified in the document, not the order they are declared in the file. In the case of packages, global options are executed before local ones.

```

278 \onlypreamble\@fileswith@ptions

```

Then we do some work.

First of all, we define the global variables. Then we look to see if the file has already been loaded. If it has, we check that it was first loaded with at least the current options. If it has not, we add the current options to the package options, set the default version to be 0000/00/00, and load the file if we can find it. Then we check the version number.

Finally, we restore the old file name, reset the default option, and we set the catcode of @.

For classes, we can immediately process the file. For other types, #2 could be a comma separated list, so loop through, processing each one separately.

```

```

File M

lthyphen.dtx

This file contains the code for loading hyphenation patterns into L^AT_EX. Most of this will end up in a file called `hyphen.ltx`. If you wish to customize your L^AT_EX system in respect of hyphenation patterns, write a file `hyphen.cfg`. If this file exists, it will be loaded instead of `hyphen.ltx`. See the comments below for additional information.

To produce the printed version of this file the following code is used. It can be extracted with the DOCSTRIP program, or one can run this file directly through L^AT_EX 2_ε.

```
1 (*driver)
2 \documentclass{ltxdoc}
3 \begin{document}
4 \DocInput{lthyphen.dtx}
5 \end{document}
6 
```

The default file `hyphen.ltx` loads hyphenation patterns for US english. If you want to load additional or other hyphenation patterns, you should create a file `hyphen.cfg`. This is best done by starting from `hyphen.ltx`.

For backward compatibility, the default file, `hyphen.ltx`, first tries to load the file `hyphen.tex`. If this file exists, an information message is issued and the appropriate defaults for T_EX's internal parameters are set: `\language` is initialized to 0, and `\lefthyphenmin` and `\righthyphenmin` to 2 and 3, respectively, to disallow x- or -xx breaks.

```
7 (*default)
8 \InputIfFileExists{hyphen.tex}%
9   {\message{Loading hyphenation patterns for US english.}%
10    \language=0
11    \lefthyphenmin=2 \righthyphenmin=3 }%
```

Otherwise, since we cannot do anything without any hyphenation patterns, an error message is printed and the IniT_EX run is terminated by invoking `\@@end` (which is the L^AT_EX 2_ε name for T_EX's `\end` primitive).

```
12   {\errhelp{The configuration for hyphenation is incorrectly
13     installed.^^J%
14     If you don't understand this error message you need
15     to seek^^Jexpert advice.}%
16   \errmessage{OOPS! I can't find any hyphenation patterns for
17     US english.^^J \space Think of getting some or the
18     latex2e setup will never succeed}\@@end}
19 
```

The following example describes the possible contents of a file `hyphen.cfg` that will load both US English and German hyphenation patterns, making the former the default. It sets `\language` to 0 for the US patterns and to 1 for the German patterns. Then `\language` is set to 0 to make this the default and the default values of `\lefthyphenmin` and `\righthyphenmin` are set.

```
\language=0
\input hyphen % (or \input ushyphen1 if the file has been renamed)
```

```
\language=1
\input ghyph31
\language=0
\lefthyphenmin=2
\righthyphenmin=3
\endinput
```

Another possibility is to use the package `babel`, by Johannes Braams. That package is distributed with a suitable `hyphen.cfg` file.

File N

ltfinal.dtx

72 Final settings

This section contains the final settings for L^AT_EX. It initialises some debugging and typesetting parameters, sets the default \catcodes and uc/lc codes, and inputs the hyphenation file.

72.1 Debugging

By default, L^AT_EX shows statistics:

```
1 (*2ekernel)
2 \tracingstats1
```

72.2 Typesetting parameters

\@lowpenalty These are penalties used internally.

\@medpenalty 3 \newcount\@lowpenalty
\@highpenalty 4 \newcount\@medpenalty
5 \newcount\@highpenalty

The default values of the picture and \fbox parameters:

```
6 \unitlength = 1pt
7 \fboxsep = 3pt
8 \fboxrule = .4pt
```

The saved value of T_EX's \maxdepth:

```
9 \@maxdepth = \maxdepth
```

\vsize initialized because a \clearpage with \vsize < \topskip causes trouble.
\@colroom and \@colht also initialized because \vsize may be set to them if a
\clearpage is done before the \begin{document}

```
10 \vsize = 1000pt
11 \@colroom = \vsize
12 \@colht = \vsize
```

Initialise \textheight \textwidth and page style, to avoid internal errors if they
are not set by the class.

```
13 \textheight=.5\maxdimen
14 \textwidth=\textheight
15 \ps@empty
```

72.3 Lccodes for hyphenation

We set things up so that hyphenation files can assume that the default (T1) lccodes are in use (at present this also sets up the uccodes). We temporarily define \reserved@a to apply \reserved@c to all the numbers in the range of its arguments.

```
16 \def\reserved@a#1#2{%
```

```

17   \@tempcnta#1\relax
18   \@tempcntb#2\relax
19   \reserved@b
20 }
21 \def\reserved@b{%
22   \ifnum\@tempcnta>\@tempcntb\else
23     \reserved@c\@tempcnta
24     \advance\@tempcnta\@ne
25     \expandafter\reserved@b
26   \fi
27 }

```

Depending on the TEX version, we might not be allowed to do this for non-ASCII characters.

```

28 \def\reserved@c#1{%
29   \count@=#1\advance\count@ by -"20
30   \uccode#1=\count@
31   \lccode#1=#1
32 }
33 \reserved@a{'\a}{'\z}
34 \ifnum\inputlineno=\m@ne\else
35   \reserved@a{"A0}{ "BC}
36   \reserved@a{"E0}{ "FF}
37 \fi

```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcodes` set to 999.

```

38 \def\reserved@c#1{%
39   \count@=#1\advance\count@ by "20
40   \uccode#1=#1
41   \lccode#1=\count@
42   \sfcodes#1=999
43 }
44 \reserved@a{'\A}{'\Z}
45 \ifnum\inputlineno=\m@ne\else
46   \reserved@a{"80}{ "9C}
47   \reserved@a{"C0}{ "DF}
48 \fi

```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose `uccode` or `lccode` isn't quite what you'd expect.

```

49 \uccode`^\^Y='\I      % dotless i
50 \lccode`^\^Y='^\^Y    % dotless i
51 \uccode`^\^Z='\J      % dotless j, ae in OT1
52 \lccode`^\^Z='^\^Z    % dotless j, ae in OT1
53 \ifnum\inputlineno=\m@ne\else
54   \lccode`^\^9d='\i    % dotted I
55   \uccode`^\^9d='^\^9d % dotted I
56   \lccode`^\^9e='^\^9e % d-bar
57   \uccode`^\^9e='^\^d0 % d-bar
58 \fi

```

Finally here is one that helps hyphenation in the OT1 encoding.

```
59 \lccode`^\^f='^\^f    % oe in OT1
```

And we also set the `\lccode` of `\-` and `\textcompwordmark` so that they do not prevent hyphenation in the remainder of the word (as suggested by Lars Helström).

```
60 \lccode`\-=`\- % default hyphen char
61 \lccode 127=127 % alternate hyphen char
62 \lccode 23 =23 % textcompwordmark in T1
```

72.4 Hyphenation

The following code will be compiled into the format file. It checks for the existance of `hyphen.cfg` in inputs that file if found. Otherwise it inputs `hyphen.ltx`. Note that these are loaded in *before* the `\catcodes` are set, so local hyphenation files can use 8-bit input.

We try to load the customized hyphenation description file.

```
63 \InputIfFileExists{hyphen.cfg}
64     {\typeout{=====
65         Local configuration file hyphen.cfg used^^J%
66 =====}%
67     \def\@addtofilelist##1{\xdef\@filelist{\@filelist,##1}}%
68 }
69 {\input{hyphen.ltx}}
70 \let\@addtofilelist\@gobble
```

72.5 Font loading

Fonts loaded during the formatting process might already have changed the `\font@submax` from `Opt` to something higher. If so, we put out a bold warning.

```
71 % \changes{v1.1c}{2000/08/23}{Fix typo in warning}
72 \ifdim \font@submax > \z@
73   \@font@warning{Size substitutions with differences\MessageBreak
74     up to \font@submax\space have occurred.\MessageBreak
75     \MessageBreak
76     Please check the transcript file
77     carefully\MessageBreak
78     and redo the format generation if necessary!
79     \@gobbletwo}%
80   \errhelp{Only stopped, to give you time to
81     read the above message.}%
82   \errmessage{}
```

We reset the macro. Otherwise every user will get a warning on every job.

```
83 \def\font@submax{Opt}
84 \fi
```

72.6 Input encoding

We temporarily define `\reserved@a` to apply `\reserved@c` to all the numbers in the range of its arguments.

```
85 \def\reserved@a#1#2{%
86   \@tempcnta#1\relax
87   \@tempcntb#2\relax
88   \reserved@b
```

```

89 }
90 \def\reserved@b{%
91   \ifnum\@tempcnta>\@tempcntb\else
92     \reserved@c\@tempcnta
93     \advance\@tempcnta\@ne
94     \expandafter\reserved@b
95   \fi
96 }

```

Set the special catcodes (although some of these are useless, since an error will have occurred if the catcodes have changed). Note that $\wedge J$ has catcode ‘other’ for use in warning messages.

```

97 \catcode`\ =10
98 \catcode`\#=6
99 \catcode`\$=3
100 \catcode`\%=14
101 \catcode`\&=4
102 \catcode`\|=0
103 \catcode`\^=7
104 \catcode`\_=8
105 \catcode`\{=1
106 \catcode`\}=2
107 \catcode`\~=13
108 \catcode`\@=11
109 \catcode`\^\I=10
110 \catcode`\^\J=12
111 \catcode`\^\L=13
112 \catcode`\^\M=5

```

Set the ‘other’ catcodes.

```

113 \def\reserved@c#1{\catcode#1=12\relax}
114 \reserved@c{`!`}
115 \reserved@c{`}
116 \reserved@a{`}{{`?`}
117 \reserved@c{`}
118 \reserved@c{`}
119 \reserved@c{`}
120 \reserved@c{`}

```

Set the ‘letter’ catcodes.

```

121 \def\reserved@c#1{\catcode#1=11\relax}
122 \reserved@a{`A}{`Z}
123 \reserved@a{`a}{`z}

```

All the characters in the range 0–31 and 127–255 are illegal, *except* tab ($\wedge I$), nl ($\wedge J$), ff ($\wedge L$) and cr ($\wedge M$).

Now allow 8-bit characters, although their use in this way is strongly discouraged. See `inputenc.dtx` for a supported mechanism for 8-bit input.

```

124 \def\reserved@c#1{\catcode#1=15\relax}
125 \reserved@a{0}{`^\H}
126 \reserved@c{`^\K}
127 \reserved@a{`^\N}{31}
128 %\ifnum\inputlineno=\m@ne
129   \catcode"7F=15
130 %\else

```

```

131 % \reserved@a{"7F}{"FF}
132 \%fi
```

72.7 Lccodes and uccodes

We now again set up the default (T1) uc/lccodes. The lower case characters need their `\uccode` and `\lccode` values set. Some of this is a repeat of the set-up before loading hyphenation files. Depending on the T_EX version, we might not be allowed to do this for non-ASCII characters.

```

133 \def\reserved@c#1{%
134   \count@=#1\advance\count@ by -"20
135   \uccode#1=\count@
136   \lccode#1=#1
137 }
138 \reserved@a{'\a}{'\z}
139 \ifnum\inputlineno=\m@ne\else
140   \reserved@a{"A0}{"BC}
141   \reserved@a{"E0}{"FF}
142 \%fi
```

The upper case characters need their `\uccode` and `\lccode` values set, and their `\sfcodes` set to 999.

```

143 \def\reserved@c#1{%
144   \count@=#1\advance\count@ by "20
145   \uccode#1=#1
146   \lccode#1=\count@
147   \sfcodes#1=999
148 }
149 \reserved@a{'\A}{'\Z}
150 \ifnum\inputlineno=\m@ne\else
151   \reserved@a{"80}{"9C}
152   \reserved@a{"C0}{"DF}
153 \%fi
```

Well, it would be nice if that were correct, but unfortunately, the Cork encoding contains some odd slots whose uccode or lccode isn't quite what you'd expect.

```

154 \uccode'`^\I % dotless i
155 \lccode'`^\I % dotless i
156 \uccode'`^\J % dotless j, ae in OT1
157 \lccode'`^\J % dotless j, ae in OT1
158 \ifnum\inputlineno=\m@ne\else
159   \lccode'`^\9d='`i % dotted I
160   \uccode'`^\9d='`^\9d % dotted I
161   \lccode'`^\9e='`^\9e % d-bar
162   \uccode'`^\9e='`^\9d0 % d-bar
163 \%fi
```

Finally here is one that helps hyphenation in the OT1 encoding.

```
164 \lccode'`^\[='`^\[ % oe in OT1
```

`\MakeUppercase` And whilst we're doing things with uc/lc tables, here are two commands to upper- and lower-case a string.

`\@uclclist` Note that this implementation is subject to change! At the moment we're not providing any way to extend the list of uc/lc commands, since finding a good interface is difficult. These commands have some nasty features, such as uppercasing

mathematics, environment names, labels, etc. A much better long-term solution is to use all-caps fonts, but these aren't generally available.

```

165 \DeclareRobustCommand{\MakeUppercase}[1]{%
166     \def\i{I}\def\j{J}%
167     \def\reserved@a##1##2{\let##1##2\reserved@a}%
168     \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%
169     \protected@edef\reserved@a{\uppercase{\#1}}%
170     \reserved@a
171 }
172 \DeclareRobustCommand{\MakeLowercase}[1]{%
173     \def\reserved@a##1##2{\let##2##1\reserved@a}%
174     \expandafter\reserved@a\@uclclist\reserved@b{\reserved@b\@gobble}%
175     \protected@edef\reserved@a{\lowercase{\#1}}%
176     \reserved@a
177 }
178 \def\@uclclist{\oe\OE\o\O\ae\AE
179     \dh\DH\dj\DJ\l\L\ng\NG\ss\SS\th\TH}

```

The above code works, but has the nasty side-effect that if you say something like:

```
\markboth{\MakeUppercase\contentsname}
{\MakeUppercase\contentsname}
```

then the uppercasing is only done to the first letter of the contents name, since the mark expands out to:

```
\mark{\protect\MakeUppercase Table of Contents}
{\protect\MakeUppercase Table of Contents}
```

In order to get round this, we redefine `\MakeUppercase` and `\MakeLowercase` to grab their argument and brace it. This is a very low-level hack, and is *not* recommended practice! This is an instance of a general problem that makes it unsafe to grab arguments unbraced, and probably needs a more general solution. For the moment though, this hack will do:

```

180 \protected@edef\MakeUppercase#1{\MakeUppercase{\#1}}
181 \protected@edef\MakeLowercase#1{\MakeLowercase{\#1}}
```

72.8 Applying Patch files

Between major releases, small patches will be distributed in files `ltpatch.ltx` which must be added at this point.

```

182 \IfFileExists{ltpatch.ltx}
183   {\typeout{=====
184     Applying patch file ltpatch.ltx^^J%
185   =====}
186   \def\fmtversion@topatch{unknown}
187   \input{ltpatch.ltx}
188   \ifx\fmtversion\fmtversion@topatch
189     \ifx\patch@level\@undefined
190       \typeout{^^J^^J^^J%
191       !!!!!!!}
192     !! Patch file 'ltpatch.ltx' not suitable for this^^J%
193     !! version of LaTeX.^^J^^J%
194     !! Please check if initex found an old patch file:^^J%
```

```

195      !! --- if so, rename it or delete it, and redo the^^J%
196      !! initex run.^^J%
197      !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^J}%
198      \batchmode \@@end
199      \else

```

The code below adds the ‘patch level’ string to the first `\typeout` in the startup banner.

```

200      \def\fmtversion@topatch{0}%
201      \ifx\fmtversion@topatch\patch@level\else
202          \def\reserved@a{\typeout##1##2\reserved@a{%
203              \typeout{##1 patch level \patch@level}##2}
204              \everyjob\expandafter\expandafter\expandafter{%
205                  \expandafter\reserved@a\the\everyjob\reserved@a}
206              \let\reserved@a\relax
207              \the\everyjob
208          }fi
209      }fi
210      \else
211          \typeout{^^J^^J^^J%
212          !!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!^J}%
213          !! Patch file ‘ltpatch.ltx’ (for version <\fmtversion@topatch>)^J%
214          !! is not suitable for version <\fmtversion> of LaTeX.^J^^J%
215          !! Please check if initex found an old patch file:^J%
216          !! --- if so, rename it or delete it, and redo the^^J%
217          !!     initex run.^^J%
218          !!!!!!!!!!!!!!!^J}%
219          \batchmode \@@end
220      }fi
221      \let\fmtversion@topatch\relax
222  }{}}

```

72.9 Freeing Memory

`\reserved@a` And just to make sure nobody relies on those definitions of `\reserved@b` and `\reserved@b` friends. These macros are reserved for use in the kernel. *Do not use them as general scratch macros.*

```

223 \let\reserved@a\@filelist
224 \let\reserved@b=\@undefined
225 \let\reserved@c=\@undefined
226 \let\reserved@d=\@undefined
227 \let\reserved@e=\@undefined
228 \let\reserved@f=\@undefined

```

`\toks`

```

229 \toks0{}
230 \toks2{}
231 \toks4{}
232 \toks6{}
233 \toks8{}

```

`\errhelp` Empty the error help message, which may have some rubbish:

```
234 \errhelp{}
```

72.10 Initialise file list

\@providesfile Initialise for use in the document. During initex a modified version has been used which leaves debugging information for `latexbug.tex`.

```
235 \def\@providesfile#1[#2]{%
236   \wlog{File: #1 #2}%
237   \expandafter\xdef\csname ver@\#1\endcsname{\#2}%
238 }
```

\@filelist Reset \@filelist so files input while making the format are not listed. The list built up so far may take up a lot of memory and so it is moved to \reserved@a where it will be overwritten as soon as almost any L^AT_EX command is issued in a class file. However the `latexbug.tex` program will be able to access this information and insert it into a bug report.

```
239 \let\@filelist\@gobble
240 \def\@addtofilelist#1{\xdef\@filelist{\@filelist,#1}}%
```

72.11 Dumping the format

Finally we make @ into a letter, ensure the format will be in the ‘normal’ error mode, and dump everything into the format file.

```
241 \makeatother
242 \errorstopmode
243 \dump
244 </2ekernel>
```

Change History

1985/11/04 ltmath.dtx	LaTeX2.09	\mathversion: Test if version defined added.	134
General:	produce warning message if line extends into margin.		
	Doesn't warn about formula overprinting equation number.	252	
1989/04/10 ltfssbas.dtx	v1.0a		
General:	Starting with version numbers!	\ifmmode added in \mathgroup	126
1989/04/10 ltfssbas.dtx	v1.0b		
General:	\preload@sizes added.	126	
	\wrong@fontshape changed to define substitution font/shape macro.	126	
1989/04/10 ltfssini.dtx	v1.0a		
General:	Starting with version numbers \newif for \tempswa added since this switch is unknown at the time when this file is read in. (latex.tex is loaded later.) \math@famname changed to \math@version.	196	
1989/04/14 ltfssbas.dtx	v1.0c		
General:	More documentation added.	126	
1989/04/15 ltfssini.dtx	v1.0b		
General:	\mathfontset renamed to \mathversion.	196	
1989/04/19 ltfssbas.dtx	v1.0d		
General:	Even more doc.	126	
1989/04/21 ltfssbas.dtx	v1.0e		
General:	Documentation is fun! Parameters of \define@mathalphabet changed.	126	
1989/04/21 ltfssini.dtx	v1.0c		
General:	Changed to conform to fam.tex.	196	
1989/04/23 ltfssbas.dtx	v1.0f		
General:	% in \getanddefinefonts added.	126	
1989/04/26 ltfssini.dtx	v1.0d		
General:	\xpt added.	196	
1989/04/27 ltfssbas.dtx	v1.0g		
General:	Documentation revised.	126	
1989/04/27 ltfssini.dtx	v1.0e		
General:	Definitions of L ^A T _E X symbols corrected.	196	
1989/04/29 ltfssbas.dtx	v1.0h		
General:	Documented problem with \halign, and \noalign	126	
	\mathversion: Test if version defined added.	134	
1989/04/29 ltfssbas.dtx	v1.0i		
General:	Removed the \halign \noalign correction (wasn't bugfree)	126	
1989/04/29 ltfssini.dtx	v1.0f		
General:	Corrections to L ^A T _E X tabular env. added.	196	
1989/05/01 ltfssbas.dtx	v1.0j		
General:	Default for \basestretch added.	126	
1989/05/22 ltfssbas.dtx	v1.0k		
General:	Lines longer than 72 characters folded.	126	
1989/05/22 ltfssini.dtx	v1.0g		
General:	Lines shortened to 72 characters	196	
1989/09/14 ltfssbas.dtx	v1.0m		
General:	Global replacement: \group to \mathgroup	126	
\mathversion:	Corrected typo: \endscname to \endcsname.	134	
1989/11/07 ltfssini.dtx	v1.0i		
General:	All family, series, and shape names abbreviated.	196	
1989/11/08 ltfssbas.dtx	v1.0o		
General:	First parameter of \define@mathalphabet and \define@mathgroup changed from string to control sequence.	126	
1989/11/14 ltfssbas.dtx	v1.0p		
\math@version:	Math version prefix 'mv@' added.	134	
1989/11/19 ltfssbas.dtx	v1.0q		
\define@newfont:	Group added.	136	
\wrong@fontshape:	Instead of calling \family\default@family, etc. we directly set \f@family, etc.	140	
1989/11/22 ltfssbas.dtx	v1.0r		
\math@version:	\def → \edef for \math@version.	134	
1989/11/25 ltfssbas.dtx	v1.0s		
General:	All \edef\font@name changed to \xdef\font@name. Necessary after introduction of \begingroup\endgroup in v1.0q.	126	
	extra/ → + in \extra@def.	126	

1989/11/26 ltfssbas.dtx v1.0t	Macro \no@alphabet@help added 126
\select@group: \bgroup/\egroup changed to \begin-group/\endgroup to avoid empty Ord atom on math list. 141	\no@alphabet@error: Changed to error call 126
1989/12/02 ltfssini.dtx v1.1b	1990/01/25 ltfssini.dtx v1.1e
General: \rmmath renamed to \mathrm 196	\nfss@text: Macro added. 198
1989/12/03 ltfssini.dtx v1.1c	1990/01/27 ltfssbas.dtx v1.2d
General: Some internal macros renamed to make them inaccessible. 196	\DeclarePreloadSizes: Font identifier set to \relax. 131
1989/12/05 ltfssbas.dtx v1.0u	1990/01/28 ltfssbas.dtx v1.2e
\addto@hook: \addto@hook added. 144	\mathgroup: \newfam let to \new@mathgroup. 127
1989/12/05 lfsstrc.dtx v1.0u fam.dtx	1990/01/28 ltfssbas.dtx v1.2f
\every@math@size: Hook \every@size added. 153	\define@newfont: Added call to \curr@fontshape macro to allow substitution. 137
1989/12/13 lfsstrc.dtx v1.0f	\wrong@fontshape: Warning message slightly changed. 140
\use@mathgroup: \expandafter added before final \fi. 156	1990/01/28 ltfssini.dtx v1.2b
1989/12/16 ltfssbas.dtx v1.1a	General: Call to \nomath added. 197
\select@group: \relax in front added. 141	1990/02/08 ltfssini.dtx v1.1g
Now four arguments. 141	General: Protected the commands \family, \series, \shape, \size, \selectfont, and \mathversion. 196
Redefinition of alphabet now simpler. 142	1990/02/16 ltfssbas.dtx v1.2g
Usage of '=' macro added. ... 142	General: Support for changes of \baselineskip without changing the size. 126
1989/12/16 lfsstrc.dtx v1.1a	\math@version: \nomath added. 134
\selectfont: Changed order of calls. 150	1990/02/16 lfsstrc.dtx v1.0i
\use@mathgroup: Redefinition of alphabet now simpler. 156	\selectfont: Changed \f@size to \lcl@currsize (see fam file). 151
Usage of '=' macro added. ... 156	1990/02/18 lfsstrc.dtx v1.0j
1990/01/18 lfsstrc.dtx v1.0h	General: Redefine unprotected version \p@selectfont instead of \selectfont. 150
General: \tracingfonts meaning changed. 146	1990/03/14 lfsstrc.dtx v1.0k
1990/01/20 ltfssbas.dtx v1.2a	General: Added code for TeX3. . 146
\math@bgroup: Def. placed in this file. 143	\extract@font: Added code for TeX3. 149
\math@egroup: Def. placed in this file. 143	\selectfont: Added code for TeX3. 151
\select@group: Def for alph id changed. 142	1990/03/30 ltfssbas.dtx v1.2h
1990/01/21 ltfssbas.dtx v1.2b	\math@egroup: Changed to have one arg. 143
\select@group: Code moved to \use@mathgroup. 142	1990/03/30 lfsstrc.dtx v1.2h
1990/01/21 lfsstrc.dtx v1.2b	\use@mathgroup: Third argument removed (see \math@egroup). 156
\use@mathgroup: Macro added to allow cleaner interface. 156	1990/04/01 ltfssbas.dtx v1.2i
1990/01/23 ltfssbas.dtx v1.2c	General: Code added from tracefn.tdx. 126
General: \no@version@warning renamed to \no@alphabet@error. 126	Support for TeX3. 126

1990/04/01 lfsstrc.dtx v1.01	\tracingfonts: Check if \tracingfonts already defined.	147	1991/03/30 ltfssini.dtx v1.2g	\newfont: Definition added.	197
	General: Part of code moved to fam.dtx.	146		\symbol: Definition added.	197
	\tracingfonts: Check if \tracingfonts defined removed again.	147	1991/07/24 ltmiscen.dtx LaTeX2.09	\@verbatim: Added \penalty\interlinepenalty to definition of \par so that \samepage works	243
1990/04/01 lfsstrc.dtx v1.00	\tracingfonts: Check if \tracingfonts defined removed again.	147	1991/08/14 ltmath.dtx LaTeX2.09	\cases: (RmS) inserted extra braces around entry for NFSS	249
1990/04/02 ltfssini.dtx v1.1i	General: \input of files now handled by docstrip.	196	1991/08/14 ltpictur.dtx LaTeX2.09	General: (RmS) inserted extra braces around entry for NFSS	307
1990/04/05 lfsstrc.dtx v1.0m	\selectfont: Call \tracingon only if \tracingfonts greater than 3.	150	1991/08/14 ltthm.dtx LaTeX2.09	\@endtheorem: Moved \itshape after \item to make it work with NFSS	329
1990/05/05 lfsstrc.dtx v1.0n	\selectfont: \tracingon with new syntax.	150	1991/08/26 ltfssini.dtx v1.1n	\p@reset@font: Macro introduced	199
1990/06/23 ltfssini.dtx v1.1k	\nfss@text: Changed to \mbox.	198	1991/08/26 ltmiscen.dtx LaTeX2.09	\@verbatim: \@@par added	243
1990/06/24 ltfssbas.dtx v1.2j	\DeclarePreloadSizes: Missing percent added.	131	1991/08/26 ltpictur.dtx LaTeX2.09	\endpicture: (RmS & FMi) extra boxing level around \picbox to guard against unboxing in math mode (proposed by John Hobby)	306
1990/06/24 lfsstrc.dtx v1.0o	\baselinestretch: Moved to tracefnt.dtx.	153	1991/08/26 ltplain.dtx LaTeX209	\tracingall: Added \errorcontextlines=\maxdimen, suggested by J. Schrod	23
	\getanddefine@fonts: \Adding tracing code.	157	1991/09/29 ltboxes.dtx LaTeX2.09	\@mpfootnotetext: (RmS) added \reset@font	279
	\Macro moved from fam.dtx.	157	1991/09/29 ltfloor.dtx LaTeX2.09	\@footnotetext: (RmS) added \reset@font	355
	Adding debug code.	157	1991/09/29 ltmath.dtx LaTeX2.09	\@eqnnum: RmS: \reset@font added.	251
	\use@mathgroup: Tracing code added.	156	1991/09/29 ltsect.dtx LaTeX2.09	\@dottedtocline: (RmS) added \reset@font for page number	339
1990/06/30 ltfssbas.dtx v1.2l	\showhyphens: Macro added.	144	1991/10/17 ltcntrl.dtx LaTeX209	\@tfor: (Rms) \xdef replaced by \def (See FMi's array.doc)	46
1990/06/30 lfsstrc.dtx v1.0p	\use@mathgroup: Added \relax after math group number.	156	1991/10/25 ltbibl.dtx LaTeX2.09	\@citex: added \reset@font, suggested by Bernd Raichle.	360
1990/07/07 lfsstrc.dtx v1.0q	\getanddefine@fonts: Group number added to tracing.	157	1991/11/01 ltfloor.dtx LaTeX2.09	\footnote: (RmS) Added \let\protect\noexpand in \footnote, \footnotemark,	
	\math@egroup: Tracing code added.	156			
	\use@mathgroup: Group number added to tracing.	156			
1990/08/27 lfsstrc.dtx 1.0r	\type@restoreinfo: Some extra tracing info.	152			
1990/08/27 lfsstrc.dtx v1.0r	\getanddefine@fonts: Correcting missing name after \tracingon.	157			
1991/03/28 ltfssini.dtx v1.1m	\copyright: Extra braces added.	198			

and \footnotetext, since \xdef is used	354
1991/11/04 ltlsts.dtx LaTeX2.09 \makelabel: (RmS) added default definition for \makelabel, to produce an error message.	268
1991/11/04 ltpplain.dtx RmS General: Removed \itemitem since never needed/useful with L ^A T _E X.	22
1991/11/06 ltbibl.dtx LaTeX2.09 \@citex: added code to remove a leading blank	360
1991/11/13 ltbibl.dtx LaTeX2.09 \@bibitem: Changed counter enumi to enumiv, as it says in the com- ment above	360
1991/11/21 ltfssini.dtx v1.1o \p@reset@font: Added extra braces for robustness.	199
Changed to protected version of macro.	199
1991/11/22 ltfloat.dtx LaTeX2.09 \footnote: (RmS) Added \let\protect\noexpand in \@xfootnote, \@xfoot- notemark, and \@xfootnote- text	354
1991/11/22 ltlsts.dtx LaTeX2.09 \@item: (RmS) Changed second call to \makelabel to \un- hbox\@tempboxa. Avoids prob- lems with side effects in \make- label and is more efficient.	268
1991/11/27 ltfssbas.dtx v1.3a General: All \family, \shape etc. renamed to \fontfamily etc.	126
1991/11/27 ltfssini.dtx v1.2a General: All \family, \shape etc. renamed to \fontfamily etc.	196
1992/01/06 ltfssini.dtx v1.2c General: added slitex code	196
1992/01/10 ltbibl.dtx LaTeX2.09 \@bibitem: Changed \c@enumiv to \value of \@listctr	360
1992/01/10 ltmath.dtx LaTeX2.09 \equation: RmS: put \hbox around \@eqnnum to typeset the equa- tion number in text mode (as in the eqnarray env.)	251
1992/01/10 ltthm.dtx LaTeX2.09 \@othm: (RmS) Check for existence of theorem environment	328
1992/01/14 ltbibl.dtx LaTeX2.09 \@biblabel: removed \hfill	362
1992/01/14 ltsect.dtx 0.0 \@starttoc: (RmS) added \imme- diate to \openout as all \write commands are also executed \immediate	338
1992/02/26 ltbibl.dtx LaTeX2.09 \@lbibitem: Added \hfill to re- store left-alignment of bibliog- raphy labels in alpha style	360
1992/03/18 ltdfns.dtx LaTeX209 General: (RMS) changed input channel from 0 to \@inputcheck to avoid conflicts with other channels allocated by \newread 29	
1992/03/18 ltffloat.dtx LaTeX2.09 \@xmpar: (RmS) added \global\@ignorefalse	350
\end@float: (RmS) changed \es- phack to \Espack	346
1992/03/18 ltlsts.dtx 0.0 General: RmS: added \@nmbrlist- false	265
1992/03/18 ltmiscen.dtx LaTeX2.09 \begin: Changed \ignoretrue to \ignorefalse (as docu- mented)	241
1992/03/21 ltfssini.dtx v1.2d General: Renamed \text to \nfss@text to make it inter- nal.	196
1992/05/12 ltfssbas.dtx v1.3c \extract@alph@from@version: Macro added.	142
\select@group: Added call to \ex- tract@alph@from@version.	142
1992/07/26 ltfssbas.dtx v1.9a \curr@fontshape:	136
\DeclareFontShape: Introduced \DeclareFontShape	127
\define@newfont:	136
\math@fonts:	141
\select@group:	141, 142
\split@name: Added splitting into \f@encoding.	136
\wrong@fontshape:	140
1992/07/26 lfsstrc.dtx v2.0b \s@fct@:	165
\s@fct@sub:	166
\selectfont:	150
\try@simple@size:	159, 160
\try@size@range:	163
\use@mathgroup:	156

1992/08/14 ltbibl.dtx LaTeX2.09 \@citex: added missing argument braces around \hbox, found by Ed Sznyter 360	1992/09/22 ltfsstrc.dtx v2.1a \getanddefine@fonts: Introduced \@tf@size for math size. 157
1992/08/14 ltboxes.dtx LaTeX209 \endminipage: (RmS) replaced \vskip-\lastskip by \unskip (proposed by FMi) 279	1992/11/13 ltfsstrc.dtx v? \hexnumber@: Made expandable. . . 198
1992/08/17 ltbibl.dtx LaTeX2.09 \@citex: simplified code for removing leading blanks in citation key (proposed by Frank Jensen and Kresten Krab Thorup) . . . 360	1992/11/23 ltcounds.dtx LaTeX209 \stepcounter: Replaced {} in \stepcounter by \begingroup \endgroup to avoid adding an empty ord in math mode 122
1992/08/19 ltsect.dtx 0.0 \@xsect: (RmS) corrected bug: stretch and shrink in argument to \hskip previously not negated 334	1992/11/26 ltboxes.dtx LaTeX2.09 \@mpfootnotetext: (RmS) added protection for \edef 279
1992/08/19 ltthm.dtx LaTeX2.09 \@othm: (RmS) Changed error message to complain about undefined counter 328	1992/11/26 ltfloat.dtx LaTeX2.09 \@footnotetext: (RmS) added protection for \edef 355
1992/08/20 ltfsstrc.dtx v1.4b \@setsize: Added \@currsize. . . 198	\footnote: (RmS) Changed all to ‘def’protect‘noexpand‘protect‘noexpand 354
1992/08/24 ltdefns.dtx LaTeX209 \@ifnextchar: (Rms) \@ifnextchar didn't work if its first argument was an equal sign. 38	1992/12/03 ltfsstrc.dtx v? \hexnumber@: Make it accept counters. 198
1992/08/24 ltmiscen.dtx LaTeX2.09 \begin: Added code to \begin to remember line number. Used by \@badend to display position of non-matching \begin. 241	1993/03/08 preload.dtx v2.0b General: Added 12pt preloads . . . 220
\verb: Changed \verb and \sverb to work correctly in math mode 244	1993/03/18 ltfsstrc.dtx v2.0c General: Changed all \@tempdima in \@tempdimb to avoid killing \numberline 126
1992/08/25 ltsect.dtx LaTeX2.09 \@sect: (FMi) replaced explicit setting of \@svsec by call to \@seccntformat 333	1993/03/18 ltfsstrc.dtx v2.1b General: Changed all \@tempdima in \@tempdimb to avoid killing \numberline 146
1992/09/18 ltlists.dtx LaTeX2.09 General: (RmS) Added warning if \item is used in math mode 266	Changed all \@tempdima in \@tempdimx to avoid killing \numberline 146
1992/09/18 lttab.dtx LaTeX2.09 \@array: Changed \par to \empty to avoid starting new row e.g. after \hline 294	1993/03/18 ltfsstrc.dtx v2.1c \DeclareSizeFunction: Added all args to avoid blanks problems 162
1992/09/19 ltfsstrc.dtx v2.0c \try@simple@size: 159	1993/04/09 lterror.dtx v1.0e \@latexerr: Mention The Companion 52
1992/09/21 ltfsstrc.dtx v1.4d \@not@math@alphabet: Macro defined. 197	1993/04/11 lterror.dtx v1.0f \@latexerr: Remove setting of errorcontextlines 52
1992/09/22 ltfsstrc.dtx v1.91a General: Introduced \tf@size for math size. 126	1993/05/05 ltftcmcmd.dtx v2.0b General: Removed all LaTeX related cmd 224
	1993/05/16 ltfsstrc.dtx v2.0e \showhyphens: Use \reset@font 144
	1993/07/16 ltfsstrc.dtx v2.1h General: Changed layout of info messages 146
	1993/07/17 ltoutenc.dtx 1.0d General: changed \catcoding @ . . 85

1993/08/03 ltmiscen.dtx LaTeX2.09	\enddocument: Changed redefinition of \global to redefinition of \setckpt.	238	1993/09/15 ltfsstrc.dtx v2.1j	General: Corrected spelling of \noxpand.	146
1993/08/05 ltpictur.dtx LaTeX2.09	\circle: (RmS) Added error message if \circle is used in math mode.	321	1993/09/19 lterror.dtx LaTeX2.09	\@invalidchar: (RmS) Error message for invalid input characters.	55
1993/08/05 ltsect.dtx LaTeX2.09	\@sect: (RmS) Made sure that \protect works correctly in expansion of \the counter . . .	333	1993/11/02 ltmath.dtx LaTeX2.09	General: RmS: Corrected description of \eqnse1, moved \eqnse1 accordingly and removed extra \tabskip assignment.	252
1993/08/05 ltspc.dtx LaTeX2e	\hspace: (RmS) Removed superfluous \leavevmode in \hspace and \hspace, as suggested by CAR.	70	1993/11/03 ltmath.dtx LaTeX2e	General: RmS: Initialized \everycr to empty	252
1993/08/05 lttab.dtx latex2e	\tabular*: Replaced \expandafter\def by \namedef.	293	1993/11/03 ltpictur.dtx LaTeX2.09	General: (RmS) changed \halign to \ialign to initialize \tabskip and \everycr	307
1993/08/06 ltbibl.dtx LaTeX2.09	\citex: Moved writing to .aux file in loop over citation keys so that leading blanks are removed there as well.	360	1993/11/11 ltfsstrc.dtx v2.1a	\normalfont: Macro added	199
1993/08/13 ltoutenc.dtx 1.0f	General: Protected against active @ sign.	85	1993/11/11 ltfsstrc.dtx v2.2a	General: Option concept added for LaTeX2e	146
1993/08/13 preload.dtx v2.0c	General: Added \relax at end of font names.	221	1993/11/14 ltclass.dtx v0.2a	\currext: Name changed from \currextension	425
1993/08/16 ltoutenc.dtx 1.0g	General: Needs space after \string	85	\fileswithoptions: Moved resetting of \default@ds, \ds@ and \declaredoptions here, from the end of \ProcessOptions.	433	
1993/08/18 ltfsdcl.dtx v2.0e	\new@mathversion: Exchanged names of encodings in warning message of \SetSymbolFont.	180	\reset@ptions: macro added	435	
1993/09/02 ltfsstrc.dtx v2.1i	General: Corrected name of sgen size function.	146	\AtEndDocument: Included extension in the generated macro name for package and class hooks.	435	
1993/09/03 ltmiscen.dtx LaTeX2.09	\verbatim@nolig@list: Replaced \noligs by extensible list	245	\documentstyle: Added \RequirePackage \unusedoptionlist stuff.	431	
1993/09/07 ltmiscen.dtx LaTeX2.09	\verb@balance@group: (RmS) Changed definition of \verb so that it detects a missing second delimiter.	244	\g@addto@macro: Made global	435	
1993/09/08 ltmiscen.dtx LaTeX2.09	\enddocument: Added warning in case of undefined references.	238	\NeedsTeXFormat: made more robust for alternative syntax for other formats.	432	
1993/09/15 ltfsbas.dtx v2.0g	\DeclareFontEncoding: Corrected: \default@T to \default@M.	129	\ProcessOptions*: Optimise 'empty option' code.	429	
			Stop adding the global option list inside class files.	429	
			1993/11/15 ltclass.dtx v0.2b		
			\documentstyle: Modified to match \ProcessOption*	431	
			\ProcessOptions*: Star form added.	429	

1993/11/17 ltclass.dtx v0.2c	\@files with @pti@ns: Macro added 434	1993/11/22 ltlength.dtx LaTeX2e	\@settodim: Macro added 125
	\@badrequireerror: Macro added 436	\@settopoint: Macro added 125	
	\@files with options: Added trap for two \LoadClass commands. 434	\settodepth: Macro added 125	
	\@twoloadclasserror: Macro added 436	\settoheight: Macro added 125	
	\CurrentOption: Name changed from \curroption 425	1993/11/22 ltlogos.dtx LaTeX2e	\LaTeXe: Macro added 71
	\DeclareOption*: Error checking added 428	\@useoption: Name changed from \executeforoption 430	
	\NeedsTeXFormat: Name changed from \NeedsFormat 432	General: Various macros now moved to latex.tex. 425	
	\ProcessOptions*: restoring \@files with @pti@ns added. 429	Warnings and errors now directly coded. 425	
1993/11/18 ltclass.dtx v0.2d	\documentstyle: Modified \RequirePackage stuff 431	1993/11/23 ltdefns.dtx LaTeX2e	\@argdef: Macro added 30
	\ExecuteOptions: Use \CurrentOption not \reserved@a ... 430	\@ifundefined: Redefined to remove a trailing \fi 38	
	\NeedsTeXFormat: \fmtname \fmtversion not \@... 432	\@newcommand: Macro added 30	
1993/11/21 ltfiles.dtx LaTeX2e	\@missingfileerror: Stop infinite looping on \er@ext 79	\@newenv: Macro interface changed 33	
	\verb: Use \verbatim@font instead of \tt 244	\@xargdef: Macro interface changed 30	
	\verbatim@font: Macro added .. 244	\@yargdef: Avoid \@?@? token Macro interface changed 31	
1993/11/22 ltclass.dtx v0.2f	\@files with options: Made the default [] not [\@unknownversion] 433	\newcommand: Macro reimplemented and extended 30	
	Made the initial version [] not [\@unknownversion] 433	\renewcommand: Macro reimplemented and extended 32	
	\@ifclasslater: Added //00 so parsing never produces a runaway argument. 427	\renewenvironment: Macro reimplemented and extended 33	
	General: \@unknownversion removed 438	\two@digits: Macro added 27	
1993/11/22 ltdefns.dtx LaTeX2e	\@minus: Macro added 28	1993/11/23 ltoutput.dtx v0.1a	\paperheight: Register added ... 378
	\@plus: Macro added 28	\paperwidth: Register added ... 378	
	\CheckCommand: Macro added ... 34	1993/11/23 ltoutput.dtx v0.1c	\@enlargepage: Command added 408
	\providecommand: Macro added . 34	\@kludgeins: Insert added 408	
1993/11/22 lterror.dtx LaTeX2e	\c@errorcontextlines: Macro added 52	\@makecol: Command changed ... 386	
	\listfiles: Removed checking for \@unknownversion 80	\@specialoutput: Command changed 382	
1993/11/22 ltfiles.dtx LaTeX2e	\@enlargethispage*: Commands added 408	1993/11/24 ltftntcmd.dtx v2.1a	\maybe@ic@: Use \t@st@ic 229
	\t@st@ic: Macro added 229	\t@st@ic: Macro added 229	
1993/11/24 ltfsini.dtx v2.1a	General: Removed \xpt stuff ... 199		
1993/11/24 ltlogos.dtx LaTeX2e	\LaTeX: Macro changed 71		
1993/11/28 ltclass.dtx v0.2h	\@twoclasseserror: Macro added 436		
	General: Assorted commands now in the kernel removed. 425		

Directory syntax checing moved to dircheck.dtx	425	\raisebox: redefined to support \height	280
Primitive filenames now terminated by space not \relax.	425	\sbox: color support	274
\endfilecontents: Don't globally allocate a write stream (always use 15)	436	extra group	274
1993/11/28 ltfiles.dtx LaTeXe		\set@color: color support	274
\@missingfileerror: Use filename parser from dircheck	79	macro added	274
1993/11/29 ltoutput.dtx v1.0b		1993/12/03 ltclass.dtx v0.2i	
\@makecol: \@makespecialcolbox added	386	\@cls@pkg: Name changed to avoid clash with output routine.	435
\@makespecialcolbox: Command added	388	General: \@onlypreamble: Many commands declared.	425
1993/11/29 ltplain.dtx LaTeXe		Removed obsolete \@document-class	425
General: All accents in decimals; suggested by Paul Taylor	23	1993/12/03 lterror.dtx v1.0b	
1993/11/30 ltoutput.dtx v1.0c		\@latexerr: Set \c@errorcontextlines to -1	52
\@tracemessage: Commands added	409	1993/12/03 ltfssini.dtx v2.1a	
1993/12/01 fontdef.dtx v2.1a		General: update for LaTeXe	196
General: Update for LaTeXe	202	1993/12/04 ltfles.dtx v0.9b	
1993/12/01 ltoutput.dtx v1.0e		\@iinput: Macro reimplemented	79
\@reinserts: Command added	388	\@input: Macro reimplemented	79
1993/12/03 ltboxes.dtx v0.1a		\IfFileExists: Macro added	78
\@argsbox: macro removed	280	\input: Macro reimplemented	79
\@begin@tempboxa: macro added	273	\InputIfFileExists: Macro added	79
\@end@tempboxa: macro added	273	1993/12/05 ltfloat.dtx LaTeXe	
\@iirbox: redefined to support \height	280	\@dblfloatplacement: Command changed	347
\@imakebox: macro modified	273	\@xfloat: Command changed	344
\@irsbox: redefined to support \height	280	1993/12/05 ltoutput.dtx v1.0f	
\@isavebox: color support	274	\@addtobot: Command changed	397
extra group	274	\@addtocurcol: Command changed	399
\@isavepicbox: extra group	275	\@addtobdblcol: Command changed	404
\@makebox: default changed from x to c	273	\@addtonextcol: Command changed	402
\@makepicbox: macro modified	273	\@addtotoporbot: Command changed	398
\@savebox: default c not x	274	\@boxfpsbit: Command added	412
\bm@b: macros added	273	\@flcheckspace: Command added	413
\endlrbbox: macro added	275	\@flsetnum: Command added	413
\fbox: extra group	275	\@flsettextmin: Command added	413
\lrbbox: color support	275	\@flstop: Commands added	410
macro added	275	\@flupdates: Command added	414
\makebox: modified	272	\@fpsadddefault: Command added	410
\mbox: extra group	273	\@getfpsbit: Command added	411
\minipage: Redefined to support extra optional arguments	278	\@opcol: Command changed	386
\newsavebox: Pass the whole of arg 1 to \@ifdefinable	274	Hook added	386
\parbox: Redefined to support extra optional arguments	277	\@outputpage: Command changed	390
		\@resetfps: Command added	412
		\@setfloattypecounts: Command added	411

\@setfpsbit: Command added	412	1993/12/08 ltspace.dtx LaTeX2e
\@shipoutsetup: Command added	390	\@bsphack: Command reimplemented
\@startcolumn: Command changed	394	64 Command reimplemented; late birthday present for Chris
\@startdblcolumn: Command changed	394	64
\@testfp: Command added	412	\@vbsphack: Command added
\@textfloatsheight: Commands added	410	65
\@topnewpage: Commands changed	380	1993/12/09 ltboxes.dtx v0.1c
\@tryfcolumn: Command changed	395	\@irsbox: fix another typo
\@writesetup: \@startpagehook added	390	280
\output: Command changed	382	1993/12/09 ltclass.dtx v0.2n
1993/12/06 ltclass.dtx v0.2k		\documentstyle: input compatibility file.
\ExecuteOptions: Preserve \CurrentOption.	430	431
1993/12/06 ltoutput.dtx v1.0f		1993/12/09 ltfiles.dtx v0.9e
\@specialoutput: Unboxing of 255 added to rescue writes	382	\document: Hook added
1993/12/06 ltoutput.dtx v1.0g		74
\@topnewpage: \@floatplacement placement bug fixed	380	1993/12/09 ltmiscen.dtx v0.9e
1993/12/07 ltclass.dtx v0.2l		\enddocument: Hook added
\ProvidesFile: Macro added	428	238
1993/12/07 ltclass.dtx v0.2m		1993/12/10 ltoutenc.dtx v1.2
\@fileswithoptions: Reset \CurrentOption	433	General: Added source code for t1enc.sty.
1993/12/07 ltoutenc.dtx 1.1		82
General: Protected all special characters with \string.	85	1993/12/11 ltfntcmd.dtx v3.0a
1993/12/07 ltoutenc.dtx v1.1		General: Complete reworking of all text commands, using just one creator function
General: Made all character numbers decimal.	82	224
Removed a lot of equal signs and the like.	82	italic correction now put in front of penalty before glue
1993/12/08 ltboxes.dtx v0.1b		224
\@begin@tempboxa: Extra braces for color support (braces removed from other macros)	273	newcommands replaced by defs
\@irsbox: fix typo	280	224
\@parboxto: \endgraf added due to extra group in \begin@tempboxa	277	newfontswitch command corrected and changed
\lrbox: move \endpfalse out of the inner group	275	224
1993/12/08 ltfntcmd.dtx v2.1b		\DeclareTextFontCommand: Macro changed
General: Macros \rm, \bf and \sf moved to classes.dtx	231	226
1993/12/08 ltlists.dtx LaTeX2e		\emph: Macro changed
\@item: use \sbox to support colour	268	227
		\fix@penalty: Macro added
		229
		\maybe@ic: Macro name changed
		228
		\maybe@ic@: Macro and name changed
		228
		\sw@slant: Macro changed
		229
		\textup: Macros changed
		227
		1993/12/11 ltmath.dtx v0.9g
		General: Added a group around the first argument of \frac to prevent changes (for example font changes) from modifying the contents of the second argument.
		251
		1993/12/11 ltoutenc.dtx v1.2a
		General: Corrected for t1enc, math.
		82
		1993/12/11 ltsect.dtx LaTeX2e
		\@author: Added default
		330
		\@title: Added default
		330
		1993/12/11 ltxref.dtx LaTeX2e
		\@setref: Macro added
		234
		\pageref: Macro reimplemented
		234
		\ref: Macro reimplemented
		234

1993/12/12 ltoutput.dtx v1.0h	\@cf1b: boxmaxdepth setting moved 393	1993/12/15 ltboxes.dtx v0.1d	\@iminipage: Changed default from ‘c’ to ‘s’ 278
	defs changed to lets 393	\@iparbox: Changed default from ‘c’ to ‘s’ 277	\@minipage: Changed default from ‘c’ to ‘s’ 278
	\@cf1t: name changed 393	extra space removed. 278	\parbox: Changed default from ‘c’ to ‘s’ 277
	\@doclearpage: defs changed to lets 385, 386		
	\@makecol: defs changed to lets . 387		
	\@resethfps: Warnings added: minimal 412		
	\@startdblcolumn: defs changed to lets 394, 395		
	\@topnewpage: braces removed .. 380	1993/12/15 ltclass.dtx v0.2p	General: Removed extra ‘.’s from \@@warnings 425
	\@tracemessage: Commands changed 409	1993/12/16 ltlogos.dtx LaTeX2e	\LaTeXe: Extended logo by DPC 71
	\@tryfcolumn: defs changed to lets 395	1993/12/16 ltmath.dtx v0.9i	
1993/12/13 ltclass.dtx v0.2o	General: Removed setting \errorcontextlines (now in latex.tex) 425	\@eqncr: use \refstepcounter instead of shortcut 253	
	\documentstyle: compatibility file now latex209.sty. 431	General: use \refstepcounter instead of shortcut 252	
	\usepackage: Fixed error handling 432	1993/12/16 ltmiscen.dtx v0.9i	General: \literal added 245
1993/12/13 ltdirchk.dtx v0.2a	General: on the ‘docstrip’ pass, do not check openin path 9	1993/12/16 ltpage.dtx LaTeX2e	\mark: Init \mark at begin document 365
	\IfFileExists: Removed interactive prompting for current directory syntax 8	1993/12/16 ltspace.dtx LaTeX2e	\bsphack: Corrected optimisation :- 64
	\strip@prefix: modified, name changed from \stripmeaning. . 4	1993/12/16 lttab.dtx latex2e	
1993/12/13 ltlists.dtx latex2e	\trivlist: Initialised \@itemlabel 265	\xhline: Measure from middle of vertical rules 302	
	\@oligs: Readded \@oligs ... 245	1993/12/17 ltclass.dtx v0.2q	\@documentclasshook: Macro added 425
	\@verbatim: Readded \@oligs . 243		\@fileswithoptions: Add \compatibility hook 433
	Removed optional argument of \item 243		\documentstyle: Match Alan’s new code. 431
	\center: Removed optional argument of \item 242	1993/12/17 ltoutenc.dtx 1.3	
	\flushleft: Removed optional argument of \item 242	General: Added this section 86	Removed all the hackery for use in \DeclareFontEncoding, and redid everything using \DeclareTextFoo. 96, 97
	\flushright: Removed optional argument of \item 242		Removed the catcode hackery, since the file is only read as a package in the preamble, and removed all the messages on the screen, which just confuse users. Replaced them by the appropriate \ProvidesPackage commands. Added XXXenc. 85
1993/12/13 ltoutenc.dtx v1.2b	General: Corrected file name in driver code. 82		
1993/12/13 lttab.dtx latex2e	\tabbing: Removed optional argument of \item 288		
1993/12/14 ltoutput.dtx v1.0i	General: Section added to declare all parameters 418		

1993/12/17 ltoutenc.dtx v1.3		
General: Added \EncodingSpecificAccent, \EncodingSpecificAccentedLetter and \EncodingSpecificCommand.	82	accent-definitions from encoing-specific definitions, and allowing encoding-specific \chardef, \let, etc.
Made Rokicki's encoding a proper encoding scheme rather than a variant of OT1.	82	Rewrote for the new syntax of \EncodingSpecific.
1993/12/17 ltoutput.dtx v1.0j		
\@opcol: Hook removed	386	1993/12/18 ltoutenc.dtx v1.3d
\@specialoutput: Page room test added	383	General: Some T1 stuff had drifted into the OT1 file.
\@topnewpage: check for vsize too small added	380	1993/12/18 ltpage.dtx LaTeX2e
Page room test added	382	\@sloppy: Added \emergencys-retch
\@tracemessage: tracefloatvals made a document command	409	1993/12/19 ltclass.dtx v0.2r
\@writesetup: —and then removed	390	\endfilecontents: Different message when ignoring a file ...
1993/12/17 ltpage.dtx LaTeX2e		436
\mark: Removed init \mark at begin document, since it doesn't work.	365	1993/12/19 ltfntcmd.dtx v3.0b
\rightmark: Stopgap solution to mark \leftmark and \rightmark work without initializing mark until the problem is solved.	364	General: \@pdef comand added .
1993/12/18 ltoutenc.dtx 1.3b		224 Added by ASAJ.
General: Fixed typos with \ProvidesPackage lines. Added the \NeedsTeXFormat line. Added the last argument to \DeclareEncoding. Moved the use of the encodings to after their declaration.	85	Made \@newfontswitch produce an error if command already exists, and added \@renew- fontswitch, ASAJ
Replaced the missing last argument to \DeclareFontEncoding.	96, 97	224 Other tidying
1993/12/18 ltoutenc.dtx 1.3c		224 Some more tidying done
General: Rewrote for the new syntax of \EncodingSpecific. 96, 97		Untidying added, so this is now a TEMPORARY version. ...
Split \EncodingSpecificAccent up into \EncodingSpecific and \DeclareAccent.	86	224 Wording changes by CAR. ...
1993/12/18 ltoutenc.dtx v1.3a		231
General: Replaced OT3 by XXX	82	\DeclareOldFontCommand: Cor- rected and tidied
1993/12/18 ltoutenc.dtx v1.3b		230
General: Corrected typos.	82	\DeclareTextFontCommand: Cor- rected and tidied
Replaced the missing last argument to \DeclareFontEncoding.	82	226
1993/12/18 ltoutenc.dtx v1.3c		1993/12/19 ltspace.dtx LaTeX2e

1994/04/19 ltpage.dtx v1.0b		1994/04/25 ltfloat.dtx v1.0e
General: Improve documentation	363	<code>\@largefloatcheck:</code> Changed warning message to give more info
1994/04/20 ltfntcmd.dtx v3.3a		Command added
General: Documentation up-dated	224	General: Changed warning mes- sages
New implementation of <code>\</code>	224	Removed obsolete tracing code
<code>\check@nocorr@:</code> Macros added .	227	1994/04/27 ltfsstrc.dtx v2.3e
<code>\maybe@ic@:</code> <code>\nocorr</code> etc removed from list of tokens to check, leaving only punctuation char- acters	229	General: Corrected item that was forgotten in last change.
1994/04/20 ltmiscn.dtx v1.0e		1994/04/28 lterror.dtx v1.0j
<code>\enddocument:</code> Changed logic for producing warning messages	239	<code>\@inmatherr:</code> Macro added
1994/04/21 ltboxes.dtx v1.0e		1994/04/28 lterror.dtx v1.1c
<code>\@iiminipage:</code> Extra <code>\bgroup</code> for colour	278	<code>\@inmatherr:</code> Replaced <code>\noexpand</code> with <code>\protect</code>
<code>\@mpfootnotetext:</code> Extra <code>\end-</code> <code>graf</code> for colour	279	1994/04/28 ltfsdcl.dtx v2.1e
<code>\endminipage:</code> Extra <code>\egroup</code> for colour	279	General: Removed all <code>\uppercase</code> in hex num parsing macros .
1994/04/21 ltfinal.dtx v0.1c		1994/04/28 ltlists.dtx v1.0c
General: Added comments, set the catcodes of 128–255.	442	General: Replaced <code>\@ltxnomath</code> by <code>\@inmatherr</code>

1994/04/28 ltpictur.dtx v0.1c	Cut-off point changed to 3\baselineskip 382
General: bezier curves added 323	
\multiput: (DPC) Ignore spaces between)(. 306	
(DPC) Macro added 306	
\picture: (DPC) Ignore spaces be- fore (. 305	
1994/04/28 lplain.dtx v1.0g	Empty column action added: \emptycol 382
General: Turn off overfull box trac- ing in log 18	
1994/04/29 ltclass.dtx v1.0a	Message changed for Frank 382
General: Change version number to 1 (no other change) 425	
1994/04/29 ltmiscen.dtx v1.0f	General: \activechar@warning changed to an info message. 366
\verbatim: \leavevmode added 243	
Change to \everypar added 243	Added \col@number. 366
1994/04/29 ltoutenc.dtx 1.4a	Documentation tidied. 366
General: Removed \EncodingSpe- cific. Renamed all the com- mands. Added \DeclareTextG- lyph and \UndeclareTextCom- mand. 86	Empty column action added. 366
Removed Rokicki's OT1 variant encoding. Moved the driver to the top. 85	Fixed bug from \dblfigrule with \topnewpage. 366
1994/04/30 lfntcmd.dtx v3.3b	Full of floats action improved. 366
General: Documentation up-dated and tidied 224	\col@number: Added \col@number 378
Prefix frag@ changed to frag in \protecteddef 224	\onecolumn: Added setting of \col@number 379
Title changed 224	
Warning changed to info message in \protecteddef 224	
1994/04/30 ltoutput.dtx v1.0n	1994/05/01 lterror.dtx v1.0k
\activechar@info: \ac- tivechar@warning changed to \activechar@info 390	\latexerr: (CAR) Added draft \latexitinfo. 52
\combinedblfloats: Removed rule in topnewpage case 394	
\emptycol: Empty column action added: \emptycol 380	1994/05/01 ltoutenc.dtx 1.4a
\flsetnum: Rogue space removed 413	General: Added the \a command. 93
\specialoutput: Cut-off point changed to 2\baselineskip 383	Added the \SaveAtCatcode and \RestoreAtCatcode com- mands. 95
Empty column action added: \emptycol 383	Removed the uc/lc table settings, since the T1 uc/lc table is now the default. 102
Extra empty column added for twocolumn case 383	Rewrote for the new syntax. 96, 97
Extra empty column added for twocolumn case (wrong, see be- low) 383	
\topnewpage: Added setting of \col@number 380	1994/05/01 ltoutenc.dtx v1.4a
	General: Removed Rokicki's encod- ing. 82
	Renamed the commands, re- moved the \EncodingSpecific command. Turned all slots into decimal. Added \a. 82
	1994/05/02 lcntrldtx v1.0l
	\break@tfor: Macro added (from ltfiles.dtx) 46
	1994/05/02 ltfiles.dtx v1.0f
	\iffileonpath: \break@loop re- named to \break@tfor 78
	\obsoletefile: Make \con- lypreamble 80
	1994/05/02 ltfinal.dtx v0.1e
	General: Added setting the 'letter' catcodes. 445
	Added setting the 'other' cat- codes. 445
	Added setting the special cat- codes. 445
	Made slot 127 illegal 445
	Set all the catcodes 442

1994/05/02 ltfinal.dtx v0.1f		Set switch for warning and end of run.	361
General: Set the catcode of control-J.	445		
1994/05/02 ltmiscen.dtx v1.0g		1994/05/05 ltfinal.dtx v0.1g	
General: Changed 91 to 1991 and moved some bits	237	General: Added empty errhelp.	442
1994/05/02 ltoutput.dtx v1.0o		\errhelp: Set error help empty.	448
\@resethfps: Code shortened	412		
General: Code of \@resethfps shortened.	366	1994/05/05 lfntcmd.dtx v3.3c	
1994/05/03 ltbibl.dtx v1.0b		\@math@egroup: Corrected \@fontswitch and added saved versions	231
\nocite: Make \nocite issue a warning for an undefined citation key.	361	General: Corrected \@fontswitch	224
1994/05/03 ltfinal.dtx v0.1f		1994/05/05 ltmiscen.dtx v1.0i	
General: Set the catcode of control-J to be ‘other’, for use in messages.	442	General: Removed braces from ifnextchar and ifstar arguments	237
1994/05/03 ltfloat.dtx v1.0f		1994/05/07 lttab.dtx v1.0c	
General: (CAR) Added \@large-floatcheck	340	\@maxtab: Changed \@firsttab to \chardef	286
Removed unnecessary braces from arguments of \@ifnextchar	340	Changed \@maxtab to \chardef	286
\end@dblfloat: \@large-floatcheck added	346	General: Removed definition of \+.	282
\end@float: (CAR) Added \@largefloatcheck	346	Removed surplus braces from \@ifnextchar constructs	282
1994/05/03 ltfssdcl.dtx v2.1f		1994/05/08 lfntcmd.dtx v3.3d	
General: Renamed \@Declare-MathDelimiter to \@Declare-MathDelimiter	174	General: Removed \@undefined-fonterror	224
1994/05/03 ltlists.dtx v1.0d		\normalsize: Removed \@unde-finedfonterror	231
\@item: \hskip changed to \kern	267	1994/05/09 lfntcmd.dtx v3.3f	
General: Removed superfluous braces	266	General: Replaced all \next by \@let@token and undo change 3.3e, whatever that was.	224
1994/05/03 ltmiscen.dtx v1.0h		1994/05/10 ltdfns.dtx v1.0n	
\@centercr: \@badcrerr replaced by \@nolnerr	242	General: (ASAJ) Added \Declare-ProtectedCommand.	27
1994/05/03 lttab.dtx v1.0d		Added \DeclareProtectedCom-mand	35
\@endpbox: Use \@finalstrut based on depth of \@arstrut-box	303	Added \makeatletter and \makeatother ASA.J.	39
1994/05/04 ltclass.dtx v1.0b		Removed braces around \@ifun-defined argument. ASA.J.	32
\NeedsTeXFormat: Changed word-ing of the warning	432	1994/05/10 lterror.dtx v1.0n	
1994/05/04 lterror.dtx v1.0m		\@latetxerr: (ASAJ) Added extra blank lines to \@latetxerr.	52
\@badcrerr: Error message re-moved	55	1994/05/10 ltmiscen.dtx v1.0j	
1994/05/05 ltbibl.dtx v1.0c		\@sverb: Slight change in error message text.	244
\@citex: Set switch for warning and end of run.	360	1994/05/11 ltboxes.dtx v1.0f	
\nocite: Do not write page number in \nocite warning message.	361	\@begin@tempboxa: Use new \color@setgroup concept.	273
		\@iiiminipage: Use new \color@setgroup concept.	278
		\@mpfootnotetext: Use new \color@setgroup concept.	279
		Use new \normalcolor and \@finalstrut.	279

General: Superfluous braces removed from several commands	272	1994/05/12 ltdefns.dtx v1.0p	
\color@setgroup: macro added for colour support	274	General: (ASAJ) Fixed a bug with \relax which was using \@gobble before defining it.	27
\endminipage: Use new \color@setgroup concept.	279	Fixed a bug with \relax which was using \@gobble before defining it.	35
1994/05/11 ltclass.dtx v1.0c		1994/05/12 ltfsbas.dtx v2.1j	
\endfilecontents: Add checks for form feed and tab	436	General: New baselinestretch concept	126
1994/05/11 ltdirchk.dtx v1.0e		Replaced hand-protected commands by \DeclareRobustCommand defs	126
General: Add \ProvidesFile as used in fd files.	3	\f@linespread: New macro	134
1994/05/11 lterror.dtx v1.0o		\fontencoding: Use \DeclareRobustCommand	132
\@latexerr: (ASAJ) Removed one of the extra blank lines to \@latexerr.	52	\fontfamily: Use \DeclareRobustCommand	133
1994/05/11 ltlogos.dtx v1.0o		\fontseries: Use \DeclareRobustCommand	133
\LaTeX: Use \DeclareProtectedCommand. ASAJ.	71	\fontshape: Use \DeclareRobustCommand	133
\LaTeXe: Use \DeclareProtectedCommand. ASAJ.	71	\fontsize: Redefined to use \set@fontsize	134
1994/05/11 ltoutenc.dtx 1.5a		\linespread: New macro	134
General: Made T1 and OT1 generate packages rather than def files. Renamed the ‘package’ module to ‘teststy’.	85	\mathversion: Use \DeclareRobustCommand	134
1994/05/11 ltoutenc.dtx v1.5a		1994/05/12 ltfssdcl.dtx v2.1g	
General: Reimplemented \DeclareTextCommand using \@changed@cmd and \DeclareProtectedCommand.	86	General: Allow \relax as undefined command	174
Renamed the commands again. Made the encoding part of the command syntax. Added the \DeclareTextCommand interface. Used \DeclareProtectedCommand.	82	Allow \relax'ed cmd's to be declared	174
\DeclareTextAccent: Reimplemented using \DeclareTextCommand.	88	1994/05/12 ltfssini.dtx v2.1i	
1994/05/11 ltspace.dtx v1.0o		General: Moved \fontencoding to fam.dtx	196
\,: Use \DeclareRobustCommand. ASAJ.	69	Moved \fontfamily to fam.dtx	196
\hspace: Use \DeclareRobustCommand. ASAJ.	69	Moved \fontseries to fam.dtx	196
1994/05/12 ltboxes.dtx v1.0g		Moved \fontshape to fam.dtx	196
\@finalstrut: macro added	281	Moved \fontsize to fam.dtx	196
\fbox: New definition, merged with \framebox	275	Moved \mathversion to fam.dtx	196
\framebox: Merged \fbox and \framebox	276	Moved \selectfont to tracefntr.dtx	196
\normalcolor: macro added for colour support	274	1994/05/12 ltfsstrc.dtx v2.3f	
		\selectfont: Use \DeclareRobustCommand	150
		1994/05/12 ltoutenc.dtx 1.5a	
		General: Removed the \SaveAtCatcode and \RestoreAtCatcode commands.	95
		Rewrote for the new syntax.	96, 97
		1994/05/12 ltoutput.dtx v1.0p	
		\@writesetup: \normalcolor added	
			390

General: \normalcolor added in various places (DPC).	366	1994/05/13 lftntcmd.dtx v3.3g
1994/05/13 ltboxes.dtx v1.0h		General: Replaced \@protecteddef by \DeclareRobustCommand
\@arrayparboxrestore: New accent system, use \let not \def	278	1994/05/13 ltfssbas.dtx v2.1k
1994/05/13 ltcounds.dtx v1.0f		General: Remove File identification 'typeout'
General: Removed \@Ialph	123	1994/05/13 ltfssbas.dtx v2.1l
Removed \@Ialph	123	\DeclareFontEncoding: Init encoding change command
1994/05/13 ltdefns.dtx v1.0q		\define@newfont: Use \@input@ for fd files
General: (ASAJ) Renamed \DeclareProtectedCommand to \DeclareRobustCommand. Removed \@if@short@command.	27	1994/05/13 ltfssdcl.dtx v2.1h
(ASAJ) Replaces \space by ' ' in \csname.	27	General: Removed file identification typeout
Renamed \DeclareProtectedCommand to \DeclareRobustCommand. Removed \@if@short@command. Moved to after the definition of \@gobble.	35	1994/05/13 ltfssini.dtx v2.1j
1994/05/13 ltdefns.dtx v1.0r		General: Removed file identification typeout
General: (ASAJ) Added logging message to \DeclareProtectedCommand.	27	1994/05/13 lfsstrc.dtx v2.3g
Added logging message to \DeclareProtectedCommand.	35	General: Removed typeouts as \ProvidesPackage writes to log.
1994/05/13 ltdefns.dtx v1.0s		1994/05/13 ltoutenc.dtx v1.5b
General: (ASAJ) Added \@backslashchar.	27	General: Added \{, \} and \\$.
(ASAJ) Coded \@ifdefinable more efficiently.	27	Renamed \DeclareProtectedCommand to \DeclareRobustCommand.
Coded more efficiently, thanks to FMI.	32	Replaces \space by ' ' in \csname.
1994/05/13 ltfiles.dtx LaTeXe		1994/05/13 ltpictur.dtx v0.1d
\listfiles: Stop \listfiles being run twice	80	General: Removed surplus braces from \@if.. constructions
1994/05/13 ltfiles.dtx v1.0g		1994/05/13 lttab.dtx v1.0d
\document: Added execution of \every@size	75	\@contfield: Colour support
1994/05/13 ltfinal.dtx v0.1h		\@startfield: Colour support
General: Added package ot1enc, and defined \@acci, \@accii and \@acciii.	442	\@stopfield: Colour support
1994/05/13 ltfinal.dtx v1.0h		\a: moved to ltoutenc
General: Added output enc stuff	447	1994/05/14 fontdef.dtx v2.1f
1994/05/13 ltfloat.dtx v1.0g		General: Removed .def files.
\@footnotetext: (DPC) Add new style colour support: \normalcolor	355	1994/05/14 ltfssbas.dtx v2.1m
(DPC) Use \@finalstrut	355	\enc@update: Macro added
\@xfloat: (DPC) Use \normalcolor	345	1994/05/14 ltfssbas.dtx v2.1n
		General: Set defaults for all \f@...
		\DeclareErrorFont: Don't set \f@encoding
		\DeclareFontEncoding: Log if encoding is redeclared
		Only init enc change cmd when new encoding
		1994/05/14 ltfssini.dtx v2.1k
		General: Init error font just before checking for fontdef.cfg
		\p@reset@font: Remove surplus braces

1994/05/14 lfsstrc.dtx v2.3h	\selectfont: Added \enc@update	151	1994/05/16 ltlogos.dtx v1.1a	General: (ASAJ) Split from ltinit.dtx.	71
1994/05/14 ltoutenc.dtx 1.5d	General: Moved the driver to the top.	85	1994/05/16 ltmath.dtx v1.0k	\ensuremath: Use \DeclareRobustCommand and add extra braces in math mode	253
1994/05/14 ltoutenc.dtx v1.5c	General: Added the fontenc package	109	1994/05/16 ltoutenc.dtx 1.5h	General: \pounds was still using u rather than ui shape.	96
	Added the fontenc package.	82	1994/05/16 ltoutenc.dtx v1.5f	General: enc files now have uc encoding name parts (FMi)	82
	Fixed a bug which caused an infinite loop if \f@encoding was incorrectly set.	82, 86		Revert code so that the encoding given is used in \DeclareTextCommand (FMi)	82
	Moved fontsmp to its own dtx file.	82	1994/05/16 ltoutenc.dtx v1.5g	General: Made fontenc.sty use the new mixed-case encoding files.	82
1994/05/14 ltoutenc.dtx v1.5d	General: Rewrote \DeclareTextCommand to define its argument to use the current encoding by default, rather than the encoding provided to \DeclareTextCommand.	82, 86		Removed the lowercasing of the filename.	109
	Tidied up the documentation.	82	1994/05/16 ltoutenc.dtx v1.5h	General: Added \NG, \ng, \TH, \th, \DH, \dh, \DJ and \dj.	82
1994/05/14 ltoutenc.dtx v1.5e	General: Replaced \ENC@cmd by \ENC-cmd.	82		Added \r (ring accent) and \k (ogonek) accents.	82
1994/05/15 ltfssbas.dtx v2.1o	General: encoding cmd changed to enc-cmd	126		Fixed a bug with \pounds.	82
1994/05/16 ltalloc.dtx v1.1a	General: (ASAJ) Split from ltinit.dtx.	41		Removed \P from the OT1 definitions file.	82
1994/05/16 ltnctrl.dtx v1.0a	General: (ASAJ) Split from ltinit.dtx.	43	1994/05/16 ltoutenc.dtx v1.5i	General: Fixed a bug with \d.	82
1994/05/16 ltdefns.dtx v1.1a	General: (ASAJ) Split from ltinit.dtx.	27	1994/05/16 ltoutput.dtx v1.0q	\@writesetup: Changed setting of accents (FMi): with the new encoding setup they can use \let. It could also use the new internal commands?	391
1994/05/16 lterror.dtx v1.1a	General: (ASAJ) Completely new error interface.	47		General: Changed setting of accents (FMi).	366
	(ASAJ) Split from ltinit.dtx.	47	1994/05/16 ltpar.dtx v1.1a	General: (ASAJ) Split from ltinit.dtx.	57
1994/05/16 ltfinal.dtx v1.0i	General: moved output enc stuff to lfonts	447	1994/05/16 lplain.dtx v1.0h	General: Comment out encoding specific commands	22
				Remove \@acci and friends again	23
1994/05/16 ltfssbas.dtx v2.1p	\fontsize: Pass \baselinestretch not \f@linespread	134		Remove unnecessary def for \item	22
	\linespread: Remove surplus braces	134		\loop: Use Kabelschacht method	21
1994/05/16 ltfssini.dtx v2.1m	\@acciii: Define saved versions of accents	201		\m@th: Remove unnecessary space	22
			1994/05/16 ltspace.dtx v1.1a	General: (ASAJ) Split from ltinit.dtx.	59

1994/05/17 ltclass.dtx v1.0e	Replaced <code>\defaultencoding</code> with <code>\encodingdefault</code>	82
<code>\@use@option</code> : Execute option after removing from list, not before	430	
1994/05/17 ltdefns.dtx v1.1b	General: (ASAJ) Added the <code>\@pro-</code> <code>tect@...</code> commands.	36
1994/05/17 ltdefns.dtx v1.1b	General: (ASAJ) Added definitions for <code>\protect</code>	27
	(ASAJ) Removed warnings and logging to <code>lterror.dtx</code>	27
	Added the discussion of pro- tected commands, defined the values that <code>\protect</code> should have.	36
1994/05/17 ltdefns.dtx v1.1c	General: (ASAJ) Redid definitions for <code>\protect</code>	27
1994/05/17 lterror.dtx v1.1b	General: (ASAJ) Moved error stuff from <code>ltdefns.dtx</code>	47
1994/05/17 ltfssini.dtx v2.1n	<code>\copyright</code> : Really add extra braces	198
	<code>\nfss@text</code> : Added braces to allow use in subscripts	198
1994/05/17 ltmath.dtx v1.0i	General: Replaced <code>\let</code> by <code>\gdef</code> , for indirect definition.	250
1994/05/17 ltoutenc.dtx v1.5j	General: Added braces to <code>\pounds</code> so it works as a subscript.	82
1994/05/18 ltdefns.dtx v1.1c	General: (ASAJ) Renamed the commands, and removed one which is no longer needed.	36
1994/05/18 ltdefns.dtx v1.1c	General: Redid the discussion and definitions, in line with the pro- posed new setting of <code>\protect</code> in the output routine.	36
1994/05/18 ltfinal.dtx v0.1j	General: Corrected the lccode for d- bar.	442
1994/05/18 ltlogos.dtx v1.1b	General: (ASAJ) Added the TeX logo.	71
	(ASAJ) Made the LATEX 2ε logo use the text font '2' rather than the math font '2'.	71
1994/05/18 ltoutenc.dtx v1.5k	General: Made dotted-i produce 'i'. Removed braces from <code>\pounds</code> and <code>\\$</code>	82
	(ASAJ) Fixed a bug with <code>\@in-</code> <code>matherr</code>	47
1994/05/19 ltbibl.dtx v1.1a	General: Initial version of <code>lt-</code> <code>bibl.dtx</code> , split from <code>ltidxbib.dtx</code>	359
1994/05/19 ltcntlen.dtx v1.1a	General: Extracted file from <code>ltc-</code> <code>ntlen</code>	121
1994/05/19 ltdefns.dtx v1.1d	General: (RmS) Added definitions for <code>\@namedef</code> and <code>\@nameuse</code> again.	27
1994/05/19 ltfinal.dtx v0.1k	General: Removed <code>\makeat</code>	442
1994/05/19 ltidxglo.dtx v1.1a	General: Initial version of <code>ltidx-</code> <code>glo.dtx</code> , split from <code>ltidxbib.dtx</code>	357
1994/05/19 ltlength.dtx v1.1a	General: Extract file <code>ltlength</code> from <code>ltcntlen</code>	125
1994/05/19 ltpagano.dtx v1.1a	General: Extract file <code>ltpagano</code> from <code>ltcntlen</code>	232
1994/05/19 ltpplain.dtx v0.1k ltfinal	<code>\showoutput</code> : used <code>\maxdimen</code> not 99999	23
	<code>\showoverfull</code> : used <code>\one</code> not 1 .	23
1994/05/19 ltxref.dtx v1.1a	General: Extract file <code>ltxref</code> from <code>ltc-</code> <code>ntlen</code>	233
1994/05/19 fontdef.dtx v2.1g	General: Removed <code>\Declare-</code> <code>FontEncoding</code> for ot1 and t1 and input .def files instead .	204
1994/05/2 ltdefns.dtx v1.1f	<code>\renewcommand</code> : Removed surplus <code>\space</code> in error	32
	<code>\renewenvironment</code> : Removed sur- plus <code>\space</code> in error	33
1994/05/20 ltdefns.dtx v1.1e	General: Changed command name from <code>\@checkcommand</code> to <code>\CheckCommand</code>	27
	<code>\CheckCommand</code> : Changed name from <code>\@checkcommand</code> to <code>\CheckCommand</code>	34
1994/05/20 lterror.dtx v1.1c	General: (ASAJ) Added <code>\@la-</code> <code>tex@info@no@line</code>	47
	(ASAJ) Added missing full stops.	47
	(ASAJ) Fixed a bug with <code>\@in-</code> <code>matherr</code>	47

1994/05/20 ltfinal.dtx v0.11	General: Use new font warning commands	444	1994/05/22 ltclass.dtx v1.0f	General: Use new warning and error commands	421
1994/05/20 ltfloat.dtx v1.0h	\@endfloatbox: Restore outer value of @nobreak switch.	347	1994/05/22 ltfdefns.dtx v1.1f	General: Use new warning and error cmds	27
1994/05/20 ltfntcmd.dtx v3.3h	General: Use new error commands	224	1994/05/22 lterror.dtx v1.1e	General: (ASAJ) Replaced bgroup by begingroup in error messages, to stop extra mathords creeping into math mode.	47
1994/05/20 ltfssbas.dtx v2.1q	General: Use new error commands	126	1994/05/22 lterror.dtx v1.2a	General: (ASAJ) Made \GenericError, \GenericWarning and \GenericInfo robust.	47
1994/05/20 ltfssrc.dtx v2.3i	General: Use new error command names	146	(ASAJ) Replaced \@generic@message and \@generic@error by \GenericError, \GenericWarning and \GenericInfo.	47	
1994/05/20 ltmiscen.dtx v1.0l	\@writefile: Added correct setting of \protect.	239	(ASAJ) Replaced \\ and tilde by \MessageBreak and \space.	47	
1994/05/20 ltmiscen.dtx v1.0m	General: Use new warning commands	237	(ASAJ) Replaces \string by \protect in some messages.	47	
1994/05/20 ltoutput.dtx v1.0s	\@writesetup: Added setting of \protect during \shipout.	390	1994/05/22 lterror.dtx v1.2d	\GenericError: (DPC) Alternative version added for old TeXs	47
	General: Added setting of \protect during \shipout.	366	(DPC) New version using long command name.	47	
1994/05/20 ltpage.dtx v1.0d	\markright: Changed setting for \protect.	364	1994/05/22 ltfloat.dtx v1.0i	General: Use new warning commands	340
1994/05/20 ltsect.dtx v1.0c	General: Correct setting of \protect.	338	1994/05/22 ltoutput.dtx v1.0t	General: Changed warnings and infos to new commands.	366
	\addcontentsline: Correct setting of \protect.	338	1994/05/22 ltpictur.dtx v0.1e	General: Use new warning cmd	304
1994/05/21 ltbibl.dtx v1.1b	General: Use new warning commands	359	1994/05/23 ltclass.dtx v1.0h	\NeedsTeXFormat: Don't stop completely when format is wrong	432
			\usepackage: Remove argument if possible	432	
1994/05/21 lterror.dtx v1.1d	General: (ASAJ) Made the error commands robust.	47	1994/05/23 ltdirchk.dtx v1.0f	General: Document \TeXversion	1
1994/05/21 ltfiles.dtx v1.0h	General: Use new error commands	72	1994/05/23 ltfsstrc.dtx v2.3j	General: Removed def of \f@warn@break	163
1994/05/21 ltlists.dtx v1.0f	General: Use new error commands	256	1994/05/23 ltoutput.dtx v1.0u	\@activechar@info: Added \MessageBreak	390
1994/05/21 ltmiscen.dtx v1.0n	General: Use new error commands	237	\@writesetup: Changed resetting of \protect after shipout to use \aftergroup	390	
1994/05/21 ltsect.dtx v1.0d	General: Use new error commands	330	General: Added \MessageBreak.	366	
1994/05/21 ltab.dtx v1.0f	General: Use new error commands	282			
1994/05/21 ltxref.dtx v1.1b	General: Use new warning commands	233			
	\newlabel: Use new warning commands	234			

Changed resetting of \protect after shipout.	366	1994/05/26 ltplain.dtx v1.1p \underbar: (DPC) changed to use \sbox	22
1994/05/24 lterror.dtx v1.2e \@latex@info@no@line: Macro added	51	1994/05/26/16 ltmiscen.dtx v1.0r General: \literal removed	245
1994/05/24 lterror.dtx v1.2f General: (DPC) wrap long lines .	47	1994/05/29 ltfssdcl.dtx v2.1j General: Use new error commands	174
1994/05/24 ltfntcmd.dtx v3.3i General: Tidying and typos fixed	224	1994/05/31 ltfinal.dtx v1.0n General: Renamed lthyphen.* to lthyphen.*.	442
1994/05/24 ltmiscen.dtx v1.0q \currenvline: Use \@empty as outer default	241	1994/06/01 ltboxes.dtx v1.0i \@frameb@x: Macro added.	276
1994/05/25 ltdirchk.dtx v1.0g \filename@parse: Mac parser had " typo for :	11	\@iframebox: New version, so \width is correct in \framebox .	276
1994/05/25 ltfntcmd.dtx v3.3j General: Insertion of \aftergroups to implement \nocorr moved to the end of the group	224	\fbox: New version, using \@frameb@x	275
\check@icr: Macros added	227	\framebox: New version, so \width is correct in \framebox	276
\check@nocorr@: Insertion of \af- tergroups moved and defaults set up for efficiency	227	1994/06/01 ltlogos.dtx v1.1d \LaTeX: Add \m@th to force math size calculations	71
\DeclareTextFontCommand: \ex- pandafter inserted	226	1994/06/01 ltoutput.dtx v1.0w General: Tidied up typesetting.	366
Insertion of \aftergroups moved	226	1994/06/08 ltfinal.dtx v1.0m General: Add patch file system	447
1994/05/25 ltoutput.dtx v1.0v General: Extra documentation.	366	1994/06/09 ltfinal.dtx v1.0n General: For \TeX2, do not set codes for higher half of character ta- ble.	443, 446
1994/05/25 ltsect.dtx v1.0e \dottedtocline: Put braces around argument 4 (the actual toc entry) to avoid font (and possibly other) changes leaking out to the leaders.	339	1994/06/09 ltfntcmd.dtx v3.3k General: Tidying and typos fixed in documentation	224
1994/05/25 ltthm.dtx v1.0c General: Modify documentation	326	1994/06/18 ltfntcmd.dtx v3.3l General: Added check for empty text	224
1994/05/25 ltvers.dtx v1.0d General: Remove PRELIMINARY TEST RELEASE from startup banner (spring is here)	25	\check@nocorr@: Added check for empty text	227
1994/05/25 ltxref.dtx v1.1c General: Modify documentation	233	1994/06/22 ltfntcmd.dtx v3.3m General: Removed space from \nfss@text	224
1994/05/26 ltfiles.dtx \LaTeX2e \missingfileerror: Modify mes- sage format	79	Renamed \check@nocorr	224
1994/05/26 ltlogos.dtx v1.1c General: Remove \SLiTeX logo	71	\check@nocorr@: Renamed \check@nocorr to \text@command to improve \long error message	227
1994/05/26 ltplain.dtx v1.1m \iterate: (CAR) added \long	21	\DeclareTextFontCommand: Re- moved space from \nfss@text	226
\underline: (CAR/FMi) changed to use box \tw@	22	1994/06/22 ltmath.dtx v1.2t classes \mathindent: Set \mathindent at the end of the class instead of at begin document	254
		1994/07/20 ltlogos.dtx v1.1e \LaTeX: Save a few tokens	71
		\LaTeXe: Save a few tokens	71

1994/07/20 ltpage.dtx v1.0h	\sloppy: Save a few tokens	365	1994/10/18 ltsect.dtx v1.0g	\@dottedtocline: Added \normal-
1994/09/16 ltfssbas.dtx v2.1s	\nfss@catcodes: Reset [and] as well, just in case	139	color for page number	339
1994/10/07 ltoutenc.dtx v1.5l	General: Moved the ogonek accent.	82	General: Added \normalcolor . . .	330
1994/10/11 ltdirchk.dtx v1.0h	\@TeXversion: Check for TeX3.14	12	1994/10/19 ltfssbas.dtx v2.1t	\DeclareFontEncoding: Add miss-
	General: Modify all of ltxcheck again	12	ing \relax.	129
1994/10/12 ltsect.dtx v1.0f	General: Doc. typos	330	1994/10/23 lfsstrc.dtx v23.k	\every@math@size: Renamed to \every@math@size
1994/10/14 fontdef.dtx v2.2a	General: New coding	202	1994/10/23 ltmath.dtx v1.0l	153
1994/10/14 ltfssini.dtx v2.2a	General: New coding for cfg files .	196	\@eqnnum: Added \normalcolor since \eqno introduces a sub-	group of the displayed math group
1994/10/14 ltmiscen.dtx v1.0s	General: Move math to other file	237	\ensuremath: Remove extra braces: but see p 168 of Leslie's book	253
1994/10/14 ltplain.dtx v1.1a	General: Moved code to other files.	13	1994/10/24 ltboxes.dtx v1.0k	\fbox: Inner braces added (to fix latex-1061)
1994/10/15 ltfssbas.dtx v2.1t	\extract@alph@from@version:		1994/10/25 fontdef.dtx v2.2c	275
	Warn if math alpha is used outside math	143	General: Added OMSenc.def . . .	204
1994/10/18 ltboxes.dtx v1.0j	\@frameb@x: \leavevmode added	276	1994/10/25 ltboxes.dtx v1.0l	
	\@iframebox: \leavevmode moved to \@frameb@x	276	\@isavepicbox: missing percent (moved from ltpatch)	275
	\@parboxto: Macro added to remove misuse of \empty	277	1994/10/25 ltdefns.dtx v1.2b	
	General: stuff from ltpatch done .	272	General: Documentation improvements	27
	\fbox: \long added	275	1994/10/25 ltoutenc.dtx 1.6a	
	\mbox: \long added	273	General: Added \textdollar, \textlbrace, \textrbrace, \textsterling, \textunderline.	97
	\sbox: \long added	274	Removed \textlbrace, \textrbrace, \textunderline to give them their proper names.	97
1994/10/18 ltclass.dtx v1.0j	General: Move \listfiles to lt- files.dtx	438	1994/10/25 ltoutenc.dtx v1.6a	
	General: Add extra test for \end- graf	27	General: Added \ProvideTextCommand, \UseTextSymbol, \UseTextAccent, \DeclareTextSymbolDefault, \DeclareTextAccentDefault, \DeclareTextCommandDefault, and \ProvideTextCommandDefault.	82
	Add star-forms for all commands	27	Added the \Provide commands, and the default definitions.	86
	\renew@environment: reset end command	33	Added the defaults.	93
1994/10/18 ltfiles.dtx v1.0i	\listfiles: code moved here from ltclass	80	Added the files OT1enc.def, T1enc.def and OMSenc.def.	93
1994/10/18 ltoutenc.dtx v1.5l	General: Added new definitions of \patterns and \hyphenation.	92	Added the OMS encoding.	102
1994/10/18 ltoutenc.dtx v1.5m	General: Added new definitions of \patterns and \hyphenation.	82	1994/10/27 ltoutenc.dtx 1.6b	
			General: Added \textasciicircum \textasciitilde

(DPC) use <code>\expandafter</code> instead of <code>\next</code>	248	<code>\listfiles</code> : Use <code>\@dofilelist</code>	80
1994/11/21 ltfloat.dtx v1.1f		<code>\nofiles</code> : There is no <code>\@gob-</code> <code>blethree...</code>	76
<code>\@endfloatbox</code> : Added reset of minipage flag	347	1994/11/30 ltfssbas.dtx v2.1y	
Corrected position of <code>\outer@nobreak</code>	347	<code>\fontshape</code> : Use <code>\@current@cmd</code> in <code>\@enc@update</code> . ASAJ.	133
<code>\@marginparreset</code> : Macro added	350	1994/11/30 ltmath.dtx 1.0q	
<code>\@savemarbox</code> : Added <code>\@setmini-</code> page etc	350	General: ASAJ: <code>\DeclareMathOp-</code> <code>erator</code> moved to AMSLET ^E X.	246
Added resetting of size and font	350	1994/11/30 ltmiscen.dtx v1.0w	
Changed to <code>\color@vbox</code>	350	<code>\enddocument</code> : (DPC) Do warnings even for <code>\nofiles</code>	239
Use <code>\@setnobreak</code> etc	350	(DPC) Use <code>\@dofilelist</code>	239
<code>\@setminipage</code> : Macro added	346	1994/11/30 ltoutenc.dtx 1.7a	
<code>\@setnobreak</code> : Macro added	345	General: Redefined <code>\a</code> for the new scheme.	93
<code>\xffloat</code> : Added <code>\@setminipage</code>	345	1994/11/30 ltoutenc.dtx v1.6g	
Added resetting of size and font	345	General: Removed new definitions of <code>\patterns</code> and <code>\hyphen-</code> <code>ation</code> , since encoding-specific commands now expand in the mouth.	92
Changed to <code>\color@vbox</code> so that large floats overflow at the bot- tom	345	1994/11/30 ltoutenc.dtx v1.7a	
Missing percents reinserted after 4, 8: these are not numbers.	344	General: Added new code for encoding-specific commands. These now expand in the mouth, which means that ligat- uring and kerning can happen.	82
Use <code>\@setnobreak</code>	345	Always load the enc.def file, so that the default encoding for the commands will change.	109
<code>\@xympar</code> : Changed to <code>\color@vbox</code>	350	Redefined <code>\@changed@cmd</code> to ex- pand in the mouth.	86
1994/11/21 ltoutput.dtx v1.1i		Removed <code>\@changed@x@mouth</code> since <code>\@changed@x</code> now expands in the mouth.	86
<code>\@addtocurcol</code> : Added <code>\if@nobreak</code> test before float box	401	Rewrote <code>\@text@composite</code> so it allows an empty argument, or an argument containing lots of commands.	88
<code>\@specialoutput</code> : Added <code>\if@nobreak</code> test	385	1994/12/01 ltfinal.dtx v1.0p	
<code>\@topnewpage</code> : Changed to <code>\color@vbox</code>	380	General: Renamed <code>lthyphen.*</code> to <code>hyphen.*</code>	442
1994/11/22 ltfssdcl.dtx v2.1o		1994/12/01 lthyphen.dtx v1.0g	
General: wrap long lines	174	General: Rename <code>lthyphen.ltx/cfg</code> to <code>hyphen.ltx/cfg</code>	440
1994/11/22 ltoutenc.dtx v1.6i		1994/12/01 ltplain.dtx v1.1g	
General: Corrected <code>\dots</code> so that there's no kerning in monowidth fonts.	82	General: (DPC) More doc changes	13
Corrected typo with <code>\mathun-</code> <code>derscore</code>	82	1994/12/02 fontdef.dtx v2.2i	
Fixed empty accents. Again.	82	General: Commented out <code>\ldots</code> . ASAJ.	202
1994/11/24 ltdefns.dtx v1.2h		1994/12/02 ltfssini.dtx v2.2c	
<code>\@newenv</code> : Added test for <code>\endgraf</code>	33	<code>\copyright</code> : <code>\copyright</code> is now in ltoutenc. ASAJ	198
1994/11/25 ltplain.dtx v1.1f			
General: (DPC) Comment out lots of obsolete code	13		
1994/11/26 ltfloat.dtx v1.1b			
<code>\footnote</code> : (ASAJ) Added <code>\pro-</code> <code>tected@xdef</code>	354		
1994/11/28 ltcntrl.dtx v1.0c			
General: Documentation improve- ments	43		
1994/11/30 ltfiles.dtx v1.0o

1995/05/24 ltfsstrc.dtx v3.0b	\ps@plain: removed \rmfamily (PR 1578) 364
General: (DPC) Fix \ProvidesFile usage 146	1995/05/27 ltfssbas.dtx v3.0b
1995/05/25 ltclass.dtx v1.0p	\mathgroup: (FMI) But a need to define \new@mathgroup 127
\endfilecontents: Delete \filec@ntents after preamble 436	1995/06/05 fontdef.dtx v2.2k
1995/05/25 ltfiles.dtx v1.0s	General: Moved math commands from ltoutenc.dtx. 217
\document: Added check for \topskip zero 75	1995/06/05 ltfinal.dtx v1.0r
1995/05/25 ltfiles.dtx v1.0t	General: Added \MakeUppercase and \MakeLowercase. 442
\@iffileonpath: (CAR) added \long 78	1995/06/05 ltoutenc.dtx v1.7k
\document: Corrected typo 75	\@inmathwarn: Removed \protected@cmd and replaced with explicit \noexpand. 86
\IfFileExists: (CAR) added \long 78	General: Allowed \ProvideTextCommandDefault after the preamble. 88

Commented out <code>\textless</code> and <code>\textgreater</code>	94	1995/06/28 ltmath.dtx v1.0t General: minor doc edits	246
Moved math commands to font- def.dtx.	95	1995/07/02 ltplain.dtx v1.1n General: Removed surplus ‘by’ and ‘=’ in various places	13
Save some tokens in <code>\textvis- iblespace</code> and <code>\textunder- score</code>	94	<code>\offinterlineskip</code> : Replaced 1000 by <code>\@m</code>	21
1995/06/06 ltfinal.dtx v1.0s General: Made <code>\MakeUppercase</code> and <code>\MakeLowercase</code> brace their argument.	442	<code>\showoutput</code> : Use <code>\showoverfull</code> to save space	23
1995/06/09 ltoutenc.dtx v1.7l <code>\DeclareTextComposite</code> : Rewrote <code>\DeclareTextComposite</code> to de- fine the composite as a no- argument command rather than a two-argument command. . .	89	<code>\tracingall</code> : Use <code>\showoutput</code> to save space	23
1995/06/11 ltspace.dtx v1.2g <code>\restorecr</code> : (CAR) <code>\relax</code> added to stop silent eating of *. . . .	70	1995/07/03 ltdfns.dtx v1.2o <code>\set@typeset@protect</code> : Use <code>\@typeset@protect</code> for init . .	38
1995/06/13 ltfinal.dtx v1.0t General: Add patch level string more carefully	448	1995/07/03 ltfnctcmd.dtx v3.3s <code>\t@st@ic</code> : Use clean interface for jump	229
Call <code>\errorstopmode</code>	449	1995/07/05 ltspace.dtx v1.2h <code>\@gnewline</code> : Use <code>\break</code>	63
1995/06/13 ltpictur.dtx v1.1b General: Use <code>\ProvidesFile</code> in au- toload	304	<code>\@no@pgbk</code> : Macro replaces <code>\@pgbk</code> and <code>\@nopgbk</code>	62
1995/06/14 ltab.dtx v1.1b General: Use <code>\ProvidesFile</code> in au- toload	282	<code>\nopagebreak</code> : Reimplemented both using <code>\@no@pgbk</code>	62
1995/06/15 ltfsbsas.dtx v3.0c General: (DPC) minor documenta- tion changes	126	1995/07/09 ltcntr.dtx v1.0f <code>\@iforloop</code> : Reimplemented using Kabelschacht method	46
1995/06/15 ltfsccmp.dtx v3.0b General: (DPC) minor documenta- tion edits	169	<code>\@iwhiledim</code> : Reimplemented using Kabelschacht method	44
1995/06/15 ltfsdcl.dtx v3.0b General: (DPC) minor documenta- tion changes	174	<code>\@iwhilenum</code> : Reimplemented using Kabelschacht method	44
1995/06/19 ltbibl.dtx v1.1h <code>\bibcite</code> : Call <code>\@newl@bel</code> so re- peated keys produce better warning.	360	<code>\@iwhilesw</code> : Reimplemented using Kabelschacht method	44
1995/06/19 ltclass.dtx v1.0q <code>\documentclass</code> : Dont redefine <code>\usepackage</code> in compat mode for /1634	431	<code>\@tfor</code> : Reimplemented using Ka- belschacht method	46
1995/06/19 ltxref.dtx v1.1e <code>\newlabel</code> : Use <code>\@newl@bel</code> to share code with <code>\bibcite</code> . .	234	1995/07/09 ltlists.dtx v1.0j <code>enumerate</code> : Use <code>\expandafter</code> . .	269
1995/06/28 ltfsini.dtx v3.0b General: (DPC) Fix documentation typos	196	<code>itemize</code> : Use <code>\expandafter</code> . .	270
		1995/07/12 ltpictur.dtx v1.1d General: allow 2e commands in 209 mode. latex/1737	304
		1995/07/13 ltdfns.dtx v1.0p General: Updates to documen- tation	27
		1995/07/13 ltfiles.dtx v1.0u General: Updates to docu	72
		1995/07/13 ltfsbsas.dtx v3.0d <code>\@@defaultsubs</code> : macro added . .	141
		<code>\@defaultsubs</code> : macro added . .	141
		General: minor documentation changes	126

\wrong@fontshape:	Change a macro not a switch to flag default font substitutions . . .	140	set \do globally	75
1995/07/13 ltmiscen.dtx v1.0z			set \topskip globally	75
\@centercr: Use \nobreak	242	1995/08/24 ltfssbas.dtx v3.0f	General: Added autoload code . .	126

1995/11/02 ltoutenc.dtx v1.7n		1995/11/27 ltfssbas.dtx v3.0n
General: Changed internal name <code>\a</code> to <code>\@tabacckludge</code> to protect against redefinition by malicious users.	93	<code>\nfss@catcodes</code> : Reset hash, for definitions in fd files
1995/11/07 ltlists.dtx v1.0k		139
<code>\@doendpe</code> : Enclosed <code>\setbox0</code> assignment by a group so that it leaves the contents of box 0 intact.	266	1995/11/28 lterror.dtx v1.2l
1995/11/07 ltoutenc.dtx v1.7o		<code>\ClassInfo</code> : Typo in autoload code /1985
General: Added <code>\leavevmode</code> at start of <code>\c</code> , otherwise the output routine might be invoked within the macro.	96	1995/11/28 ltffloat.dtx v1.1n
Changed <code>\char32</code> to <code>\@xxxii</code> (two tokens less).	97	General: documentation fixes
Replaced octal number 27 by decimal number 23 to protect against the quote character being active.	97	1995/11/28 ltfsstrc.dtx v3.0g
Replaced some 0's by <code>\z@</code> (faster).	97	General: documentation fixes
1995/11/10 ltoutput.dtx v1.1s		1995/11/28 ltoutenc.dtx v1.7r
<code>\@shipoutsetup</code> : Command removed	390	General: Added math mode checks to text commands.
<code>\@writesetup</code> : Command removed	390	doc fixes
In-lined	390	Renamed <code>\@changed@x@err</code> to <code>\TextSymbolUnavailable</code>
1995/11/14 ltclass.dtx v1.0t		86
<code>\@unprocessedoptions</code> : Allow empty option	436	1995/11/29 ltoutenc.dtx v1.7t
<code>\@loadwithoptions</code> : macro added	431	General: Added <code>\textasciicircum</code> , <code>\textasciitilde</code> , <code>\textbackslash</code> , <code>\textbar</code> , <code>\textgreater</code> and <code>\textless</code>
<code>\LoadClassWithOptions</code> : macro added	431	Added <code>\textasciicircum</code> , <code>\textasciitilde</code> , <code>\textreg-</code> istered and <code>\texttrademark</code>
<code>\RequirePackageWithOptions</code> : macro added	431	Added <code>\textbackslash</code> and <code>\textbar</code>
1995/11/17 ltfssbas.dtx v3.0m		94
<code>\@wrong@font@char</code> : (DPC) Macro added. latex/1676	141	Added <code>\textless</code> and <code>\textgreater</code>
<code>\define@newfont</code> : Redefine <code>\typeout</code> latex/1676	136	1995/12/01 ltoutenc.dtx v1.7u
<code>\wrong@fontshape</code> : Support <code>\@wrong@font@char</code> latex/1676	140	General: Made <code>\SS</code> a Default, rather than having the default point to the OT1 definition.
1995/11/17 ltoutenc.dtx v1.7p		94
<code>\UseTextSymbol</code> : Support <code>\@wrong@font@char</code> latex/1676	91	1995/12/04 ltspace.dtx v1.2k
1995/11/18 ltoutenc.dtx v1.7q		<code>\nobreakspace</code> : (Macro added
<code>\UseTextSymbol</code> : Modify message slightly	91	69
1995/11/21 fontdef.dtx v2.2n		1995/12/04 ltspace.dtx v1.2l
General: Incorporate changed figures, as in plain.tex	216	<code>\@xobesp</code> : (braces added to definition of tilde
		69
		1995/12/04 preload.dtx v2.4e
		General: Ulrik Vieth. added 12pt OMS and OML preloads /1989
		222
		1995/12/05 ltdefns.dtx 1.2w
		<code>\@unexpandable@noexpand</code> : Removed as never used. internal/1733
		36
		1995/12/05 ltfiles.dtx v1.1c
		<code>\document</code> : <code>\ignorespaces</code> added for latex/1933
		76
		1995/12/05 ltffloat.dtx v1.1n
		<code>\@textsuperscript</code> : Use <code>\ensuremath</code> for latex/1984.
		354
		1995/12/05 ltoutenc.dtx v1.7v
		<code>\@inmathwarn</code> : Changed <code>\TextSymbolUnavailable</code> text
		87

1995/12/06 ltfssbas.dtx v3.00		1996/05/08 ltfsstrc.dtx v3.0h
\@nfss@catcodes: Reset hat, for typeouts etc in fd files	139	\math@egroup: Use \bgroup instead of \begingroup to match a ker- nel change made in 1994!
1995/12/07 ltbibl.dtx v1.11		1996/05/09 lfntcmd.dtx v3.3t
\@citex: Restored name of \G@refundefinedtrue	360	\check@icr: Default definitions added
